What is a Watershed Management Authority (WMA)?

- An intergovernmental agreement between jurisdictions to address flood risk, water quality, and watershed education
- WMAs authorized in 2010 by the Iowa Legislature
- Maquoketa River WMA established in 2017

Maquoketa River Watershed Authority Board

Location

What is a watershed?

- An area that channels water to a common outlet
- Watersheds come in a variety of sizes
- MRW is a HUC-8 watershed, 1,100,000 acres, containing smaller sub-watersheds
- HUC stands for Hydrological Unit Code

- MRW contains 56 HUC-12s
- 10,000 to 40,000 acres in size

Brief Overview of MRW Planning Efforts

-  **Goal 1** Improve water quality through techniques for nutrient management, erosion reduction, and increased infiltration
-  **Goal 2** Improve watershed flood management
-  **Goal 3** Increase watershed awareness and involvement among stakeholders
-  **Goal 4** Preserve, protect and improve ecologically sensitive habitats and ecosystems in the watershed
-  **Goal 5** Establish the WMA as a trusted community resource

- **Maquoketa Watershed Plan Phase I**

- Identified 5 broad management goals for the entire watershed that focused on flooding, water quality, awareness, and habitat health

- **Maquoketa Watershed Plan Phase II**

- Prioritize sub-watersheds to implement Phase I management practices
- Provide guidance on site-specific project selection

What's in the plan?

Stakeholder Interviews

- Leaders from MRW communities (13 of 41)
- Farm Service Providers

HUC-10 Sub-watershed Profiles

- Individualized “community profiles” for each HUC-10 in the MRW

HUC-12 Sub-watershed Analysis

- Analysis of variables for each key issues: Flooding, Nitrates, Phosphorus & Soil Loss, and Diminished Recreation

HUC-12 Sub-watershed Prioritization and Individualized Plans

- Prioritized sub-watersheds based on analysis results
- Individualized plans for the top five priority sub-watersheds

Engagement Results

Communities

10 of 13 showed interest in projects that benefit recreation and economic development

12 of 13 mentioned water-related assets

6 of 13 communities have extensive water management practices are underway

All communities showed widespread support for WMA activities

Farm Service Providers

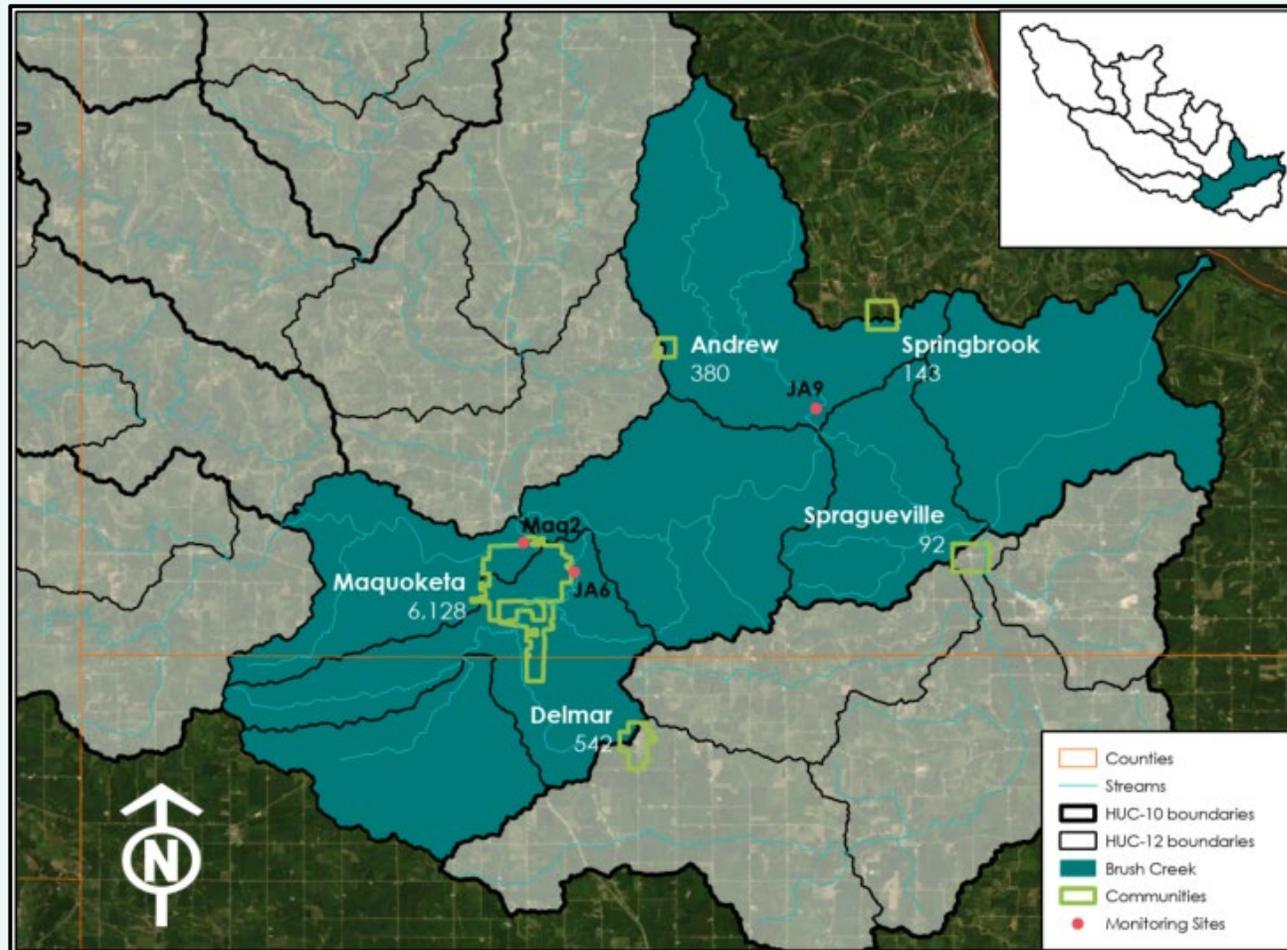

Conservation practice adoption largely depends on:

- Initial success
- Seeing neighbors' success

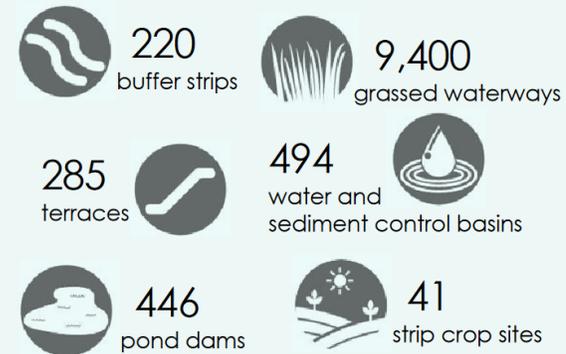

HUC-10 Profile: Brush Creek

Brush Creek is in the southern portion of the Maquoketa River Watershed and drains the watershed to the Mississippi River. It comprises 130,889 acres and seven HUC-12s. This sub-watershed contains the City of Maquoketa as well as all or part of four other smaller incorporated cities and is split between Jackson and Jones counties. Notable features include the Prairie Creek Recreation Area, a 273-acre that features limestone bluffs and woodlands, and the Jackson County Recreation Trail, a 7-mile long limestone path.

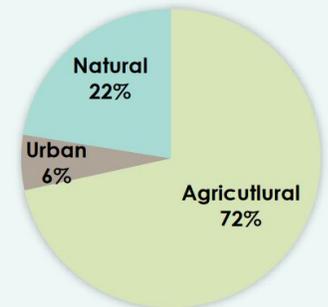

Existing Management Practices:

Existing Point-Source Pollution:

17 Permitted CAFOs and Open Feed Lots
4 Permitted wastewater treatment facilities

Land Use:

Total Miles of Streams: 126.7

Reasons for impairment include fish kills, loss of native mussels, and E. Coli.

Water Quality Monitoring Results (2019-2021 average)

Sites	Chloride (mg/L)	Dissolved Phosphorous (mg/L)	E. Coli Bacteria (CFU/100ml)	Nitrate (mg/L)	Sulfate (mg/L)	Turbidity (NTUs)
JA6	18.21	0.24	661.88	4.47	19.28	36.33
JA9	13.14	0.27	4,054.13	4.75	15.06	25.83
Maq2	15.09	0.08	131.00	3.62	19.19	25.67
Standard	5 to 250	1	235	10	500 to 2000	25

Standards are from the US EPA and IA DNR. Chloride and sulfate standards depend on the water hardness. E. Coli criteria listed is for waterbodies designated for swimming. Turbidity listed is the limit for each point source.

Sub-watershed Analysis

Key issues: Flooding, Nitrate Pollution, Phosphorus/Soil loss, Diminished Recreation

Maps of 17 metrics to understand HUC-12 variation

Identified priority HUC-12s for planning efforts

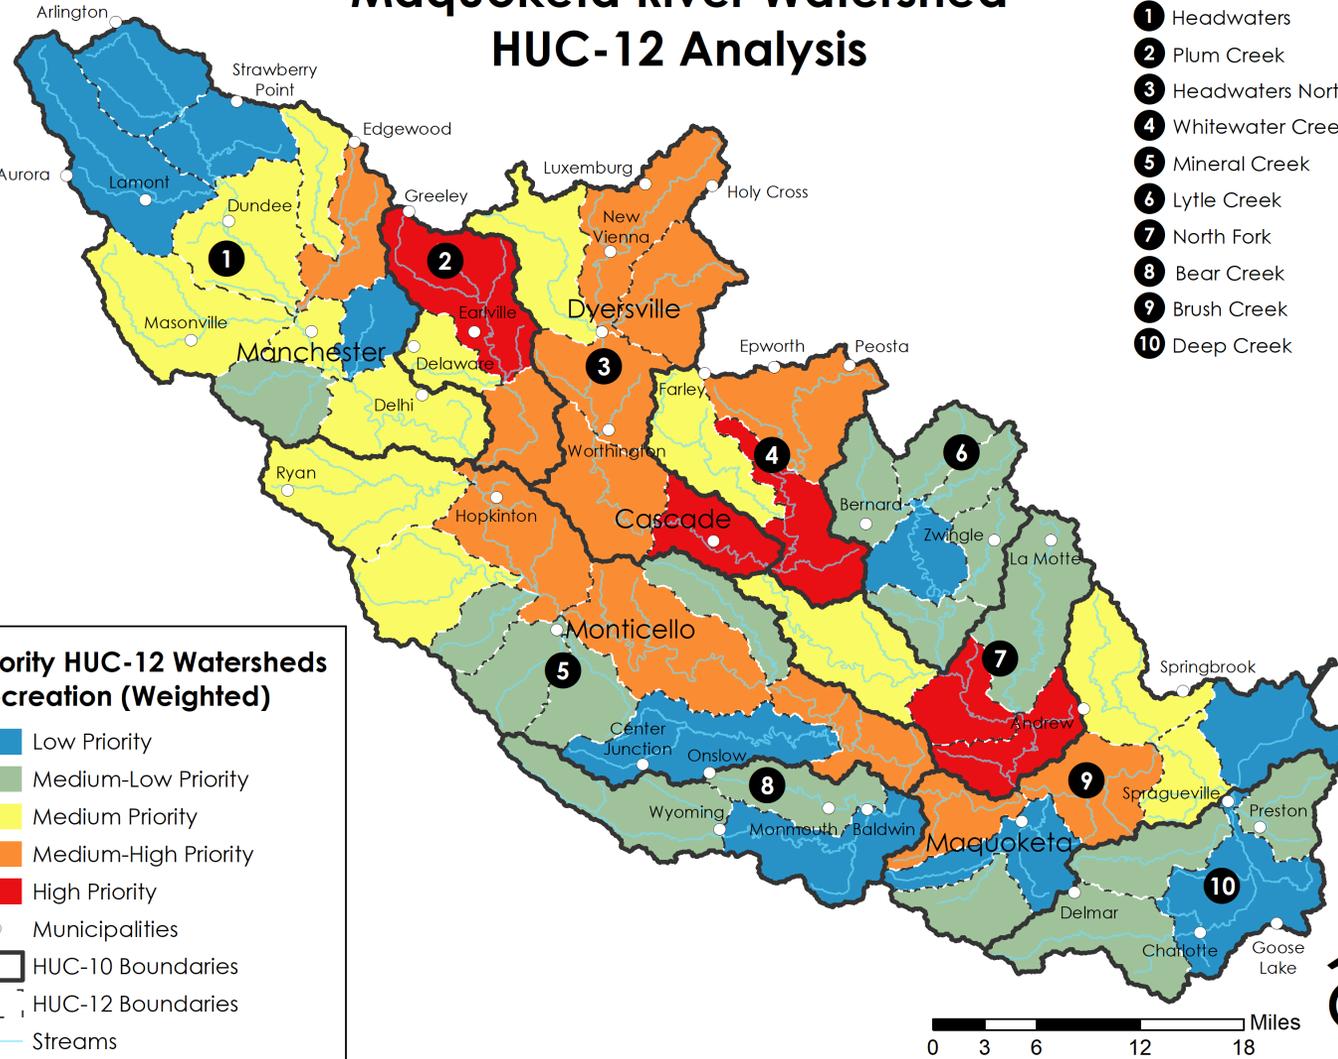

Maquoketa River Watershed HUC-12 Analysis

Why Headwaters Plum Creek?

The **Headwaters Plum Creek** HUC-12 is in the upper part of the Maquoketa River Watershed, within the Plum Creek HUC-10. Out of the 56 HUC-12 sub-watersheds in the MRW, Headwaters Plum Creek is the highest priority, based on the combined scores from the sub-watershed analysis. For each of the four key issues, this sub-watershed ranked 7th in flooding risk, tied for 2nd in nitrate pollution, 5th in phosphorous and soil runoff, and 5th in diminished recreation.

Phase 1 Goals & Objectives	Priority	Indicators
Goal 1: Improve water quality through techniques for nutrient management, erosion reduction, and increased infiltration		
1.1: Engage with the agricultural community to encourage techniques that increase field infiltration and reduce soil erosion	MEDIUM	<ul style="list-style-type: none"> ACPF RUSLE
1.2: Engage with agricultural community to reduce and maximize efficiency of agricultural nutrient application	HIGH	<ul style="list-style-type: none"> Monitored Nitrate Monitored E.coli CAFOs
1.3: Encourage practices that slow the flow of urban stormwater to increase infiltration and reduce erosion	LOW	<ul style="list-style-type: none"> Community size Impervious surfaces
1.4: Encourage the use of bacteria management to reduce E. Coli and other bacteria levels	HIGH	<ul style="list-style-type: none"> Impaired streams Monitored E.coli
1.5: Encourage and increase the implementation of wetlands to filter water pollutants	HIGH	<ul style="list-style-type: none"> Acres of wetlands ACPF
1.6: Continue to document and report water quality indicators	HIGH	<ul style="list-style-type: none"> Water quality monitoring data (all indicators)

Management Practice	ACPF Suggestion	IA BMP Mapping Project
Bioreactor	1	Not analyzed
Grassed waterways	1,674 (286 miles)	584 (194 miles)
Ponds	56	5 pond dams
WASCOBs	1 (0.06 miles)	17 (0.75 miles)
Terraces	Not analyzed	26
Contour buffer strips	Not analyzed	6 (462 acres)
Stream bank stiff stemmed grasses	135 acres	Not analyzed
Stream bank stabilization	335 acres	Not analyzed

Plan Implementation: Guidance

Funding Sources

- IDALS, USDA, US EPA, IA DNR

Phase I Objectives Prioritized

- High, Medium, or Low

Plan Implementation: Next Steps

Follow sub-watershed plans for priority HUC-12s

Identify larger-scale site specific projects in priority HUC-12s

Develop sub-watershed plans for lower-priority HUC-12s

Continue support for projects and programs in lower-priority HUC-12s

Reassess key issues and variables used in the Sub-watershed Analysis every 5 years

Who is this plan for?

WMA staff to focus their efforts.

Landowners to choose appropriate conservation practices and get WMA support.

Local communities to understand broader conditions and foster collaboration between cities and the WMA.

Read profiles and sub-watershed analysis to understand **existing** conditions.

Look at ranking maps and priority HUC-12 plans to identify areas for **short-term** project implementation.

Follow project selection guidance and objective priorities to maximize available resources and **meet long-term** watershed goals.

Reduced flood risk

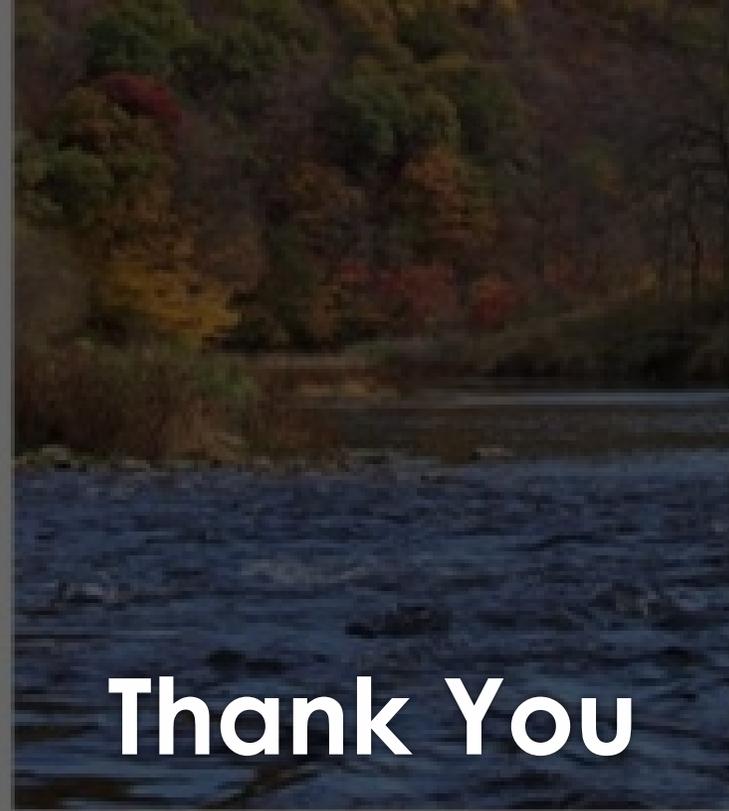

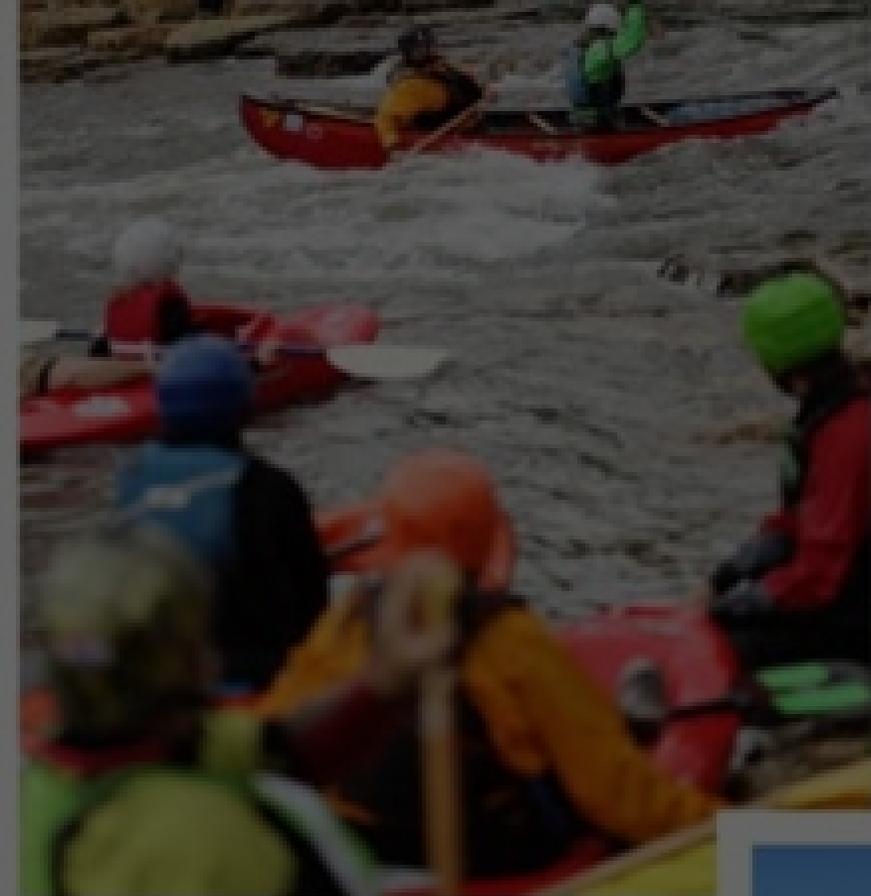

Enhanced recreational opportunities

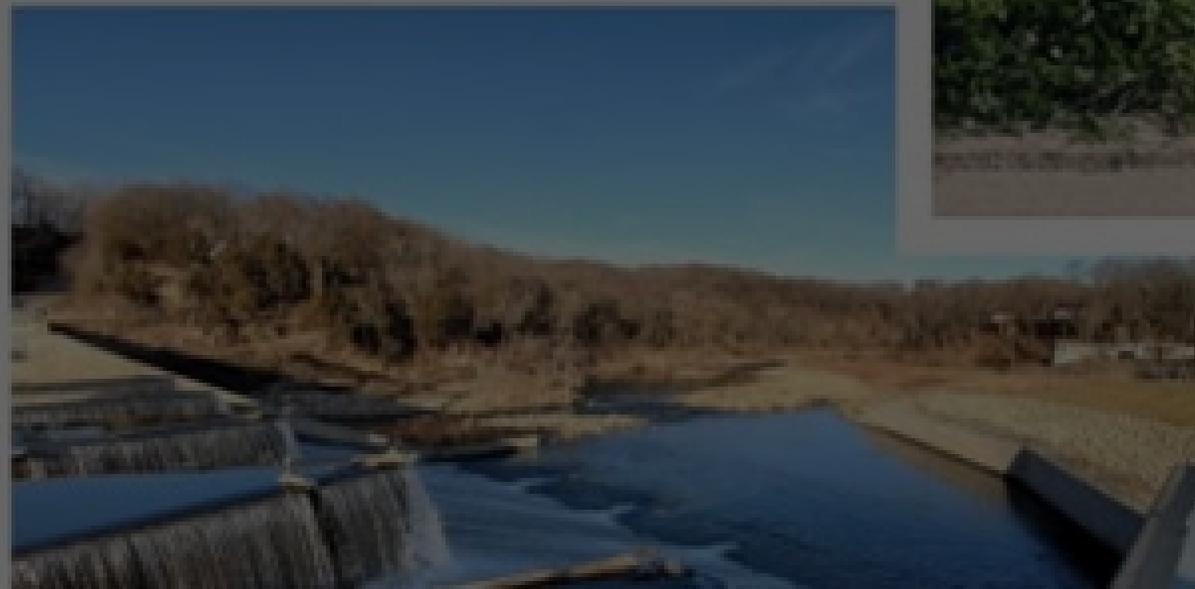

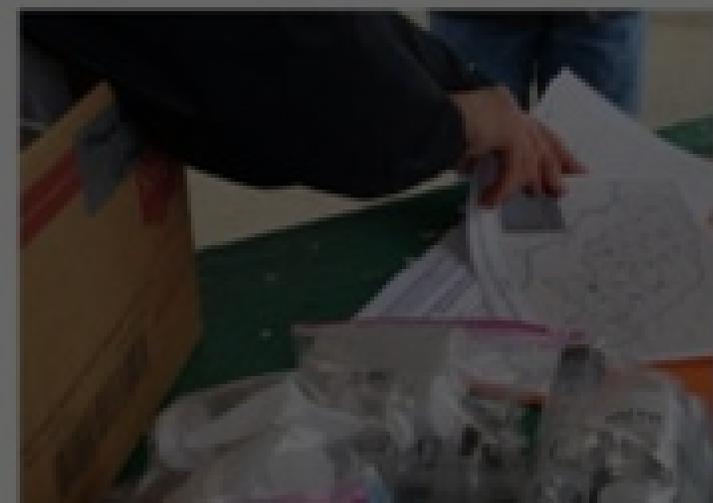

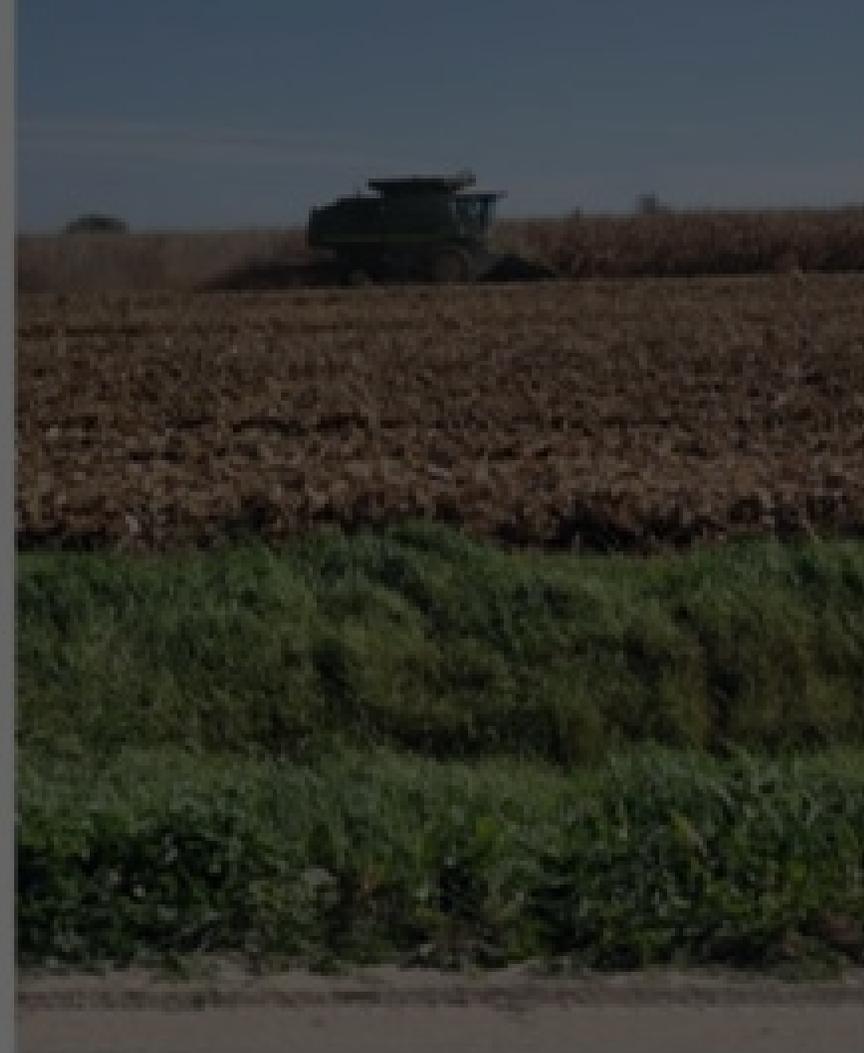

Improved water quality indicators

Greater collaboration between communities

Thank You

Appendix

Variable Weights

Metric	Weight	Justification for including
Flooding risk (40%)		
Acres of public conservation and recreation land	20%	Impact: estimates potential flood damage to public resources
Total building value in the FHA	7%	Impact: estimates potential flood damage to private property
Total crop value in the FHA	16%	Impact: estimates potential flood damage to private property
Total population in the FHA	18%	Impact: proxy for people who will be affected the most by flooding
Number of existing management practices	25%	Mitigation: proxy for areas that are already willing to implement projects
Percent of area that is impervious surfaces	14%	Cause: proxy for areas that contribute more to flooding

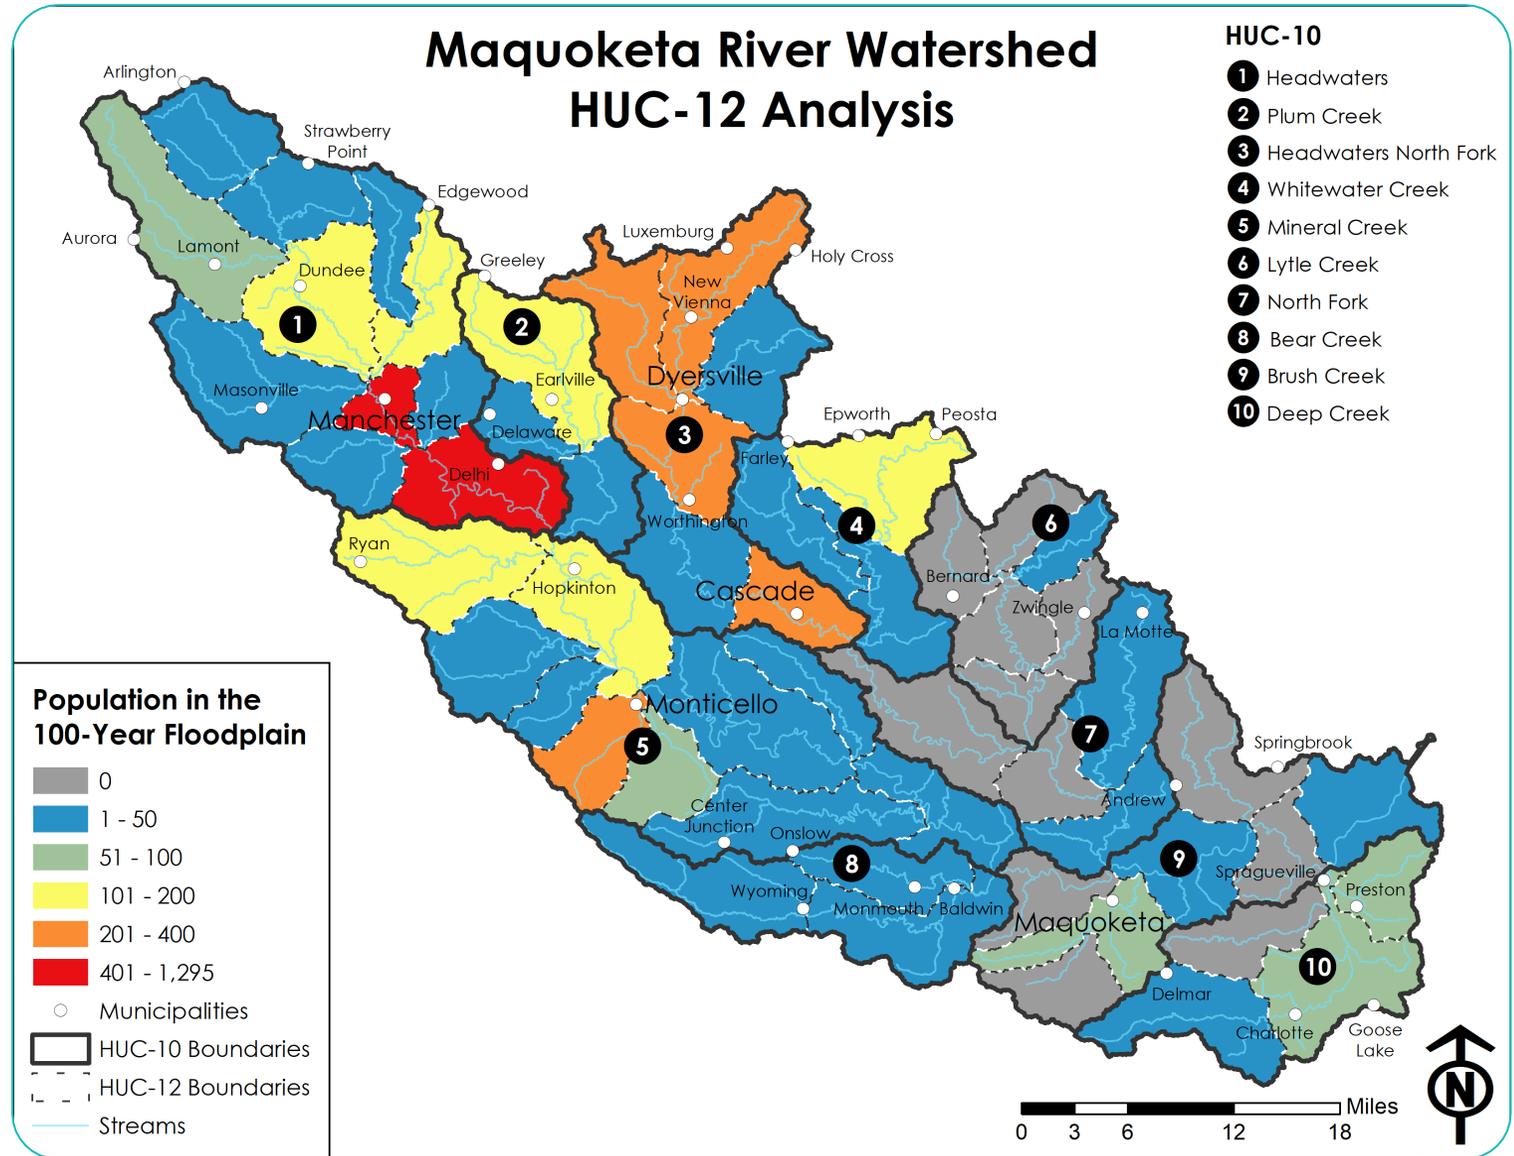

Metric	Weight	Justification for including
Nitrate Pollution (30%)		
Number of susceptible active wells	30%	Impact: proxy for public cost of treatment to avoid human exposure to nitrates
Tons per acre of soil runoff	10%	Cause: estimates magnitude of non-point sources of nitrogen
Number of CAFOs and water treatment facilities	23%	Cause: identifies point sources of nitrogen
Number of existing management practices	12%	Mitigation: proxy for areas already willing to implement projects
Monitored nitrate concentrations	25%	Impact: identifies most recent measured nitrate levels

Variable Weights

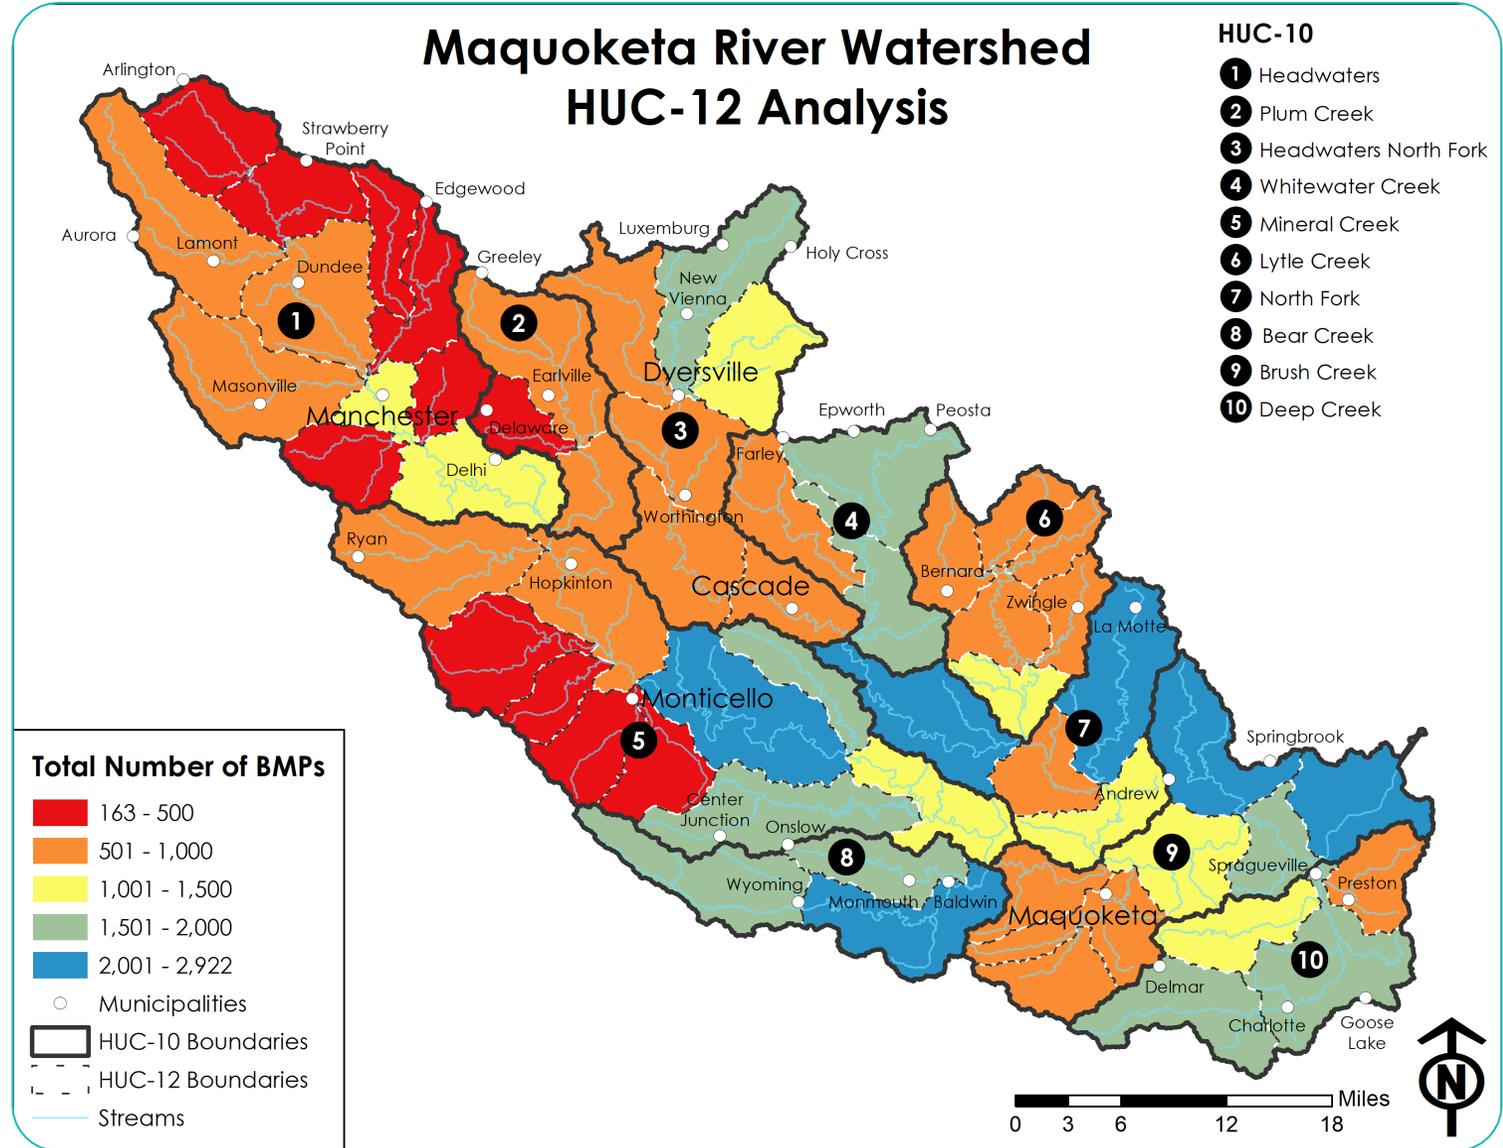

Metric	Weight	Justification for including
Phosphorous and Soil Loss (30%)		
Tons per acre of soil runoff	22%	Cause: estimates magnitude of non-point sources of phosphorous, which bonds with soil particles as they enter waterways
Number of CAFOs and water treatment facilities	25%	Cause: identifies point sources of phosphorous
Number of existing management practices	16%	Mitigation: proxy for areas already willing to implement projects
Monitored phosphorous concentrations	13%	Impact: identifies most recent measured phosphorous levels
Monitored turbidity	11%	Impact: proxy for sedimentation levels in waterways
Percent of area that is hydrologic group D	13%	Cause: proxy for soil loss based on runoff potential

Metric	Weight	Justification for including
Recreation (10%)		
Acres of public conservation and recreation land	20%	Mitigation: identifies areas open to the public for recreation
Acres of Wetlands	5%	Mitigation: estimates magnitude of existing wetland habitat for wildlife
Miles of streams impaired by fish kills	35%	Impact: proxy for magnitude of impairment, which is determined by ability to use a stream for various levels of recreation
Miles of streams impaired by E. Coli	27%	Impact: proxy for magnitude of impairment, which is determined by ability to use a stream for various levels of recreation
Miles of streams impaired by native mussel loss	13%	Impact: proxy for magnitude of impairment, which is determined by ability to use a stream for various levels of recreation

References

Communities

- 41 communities in MRW
- 20 WMA
- 10 HUC-10s

Timeline

**August
2021**

- Planning team site visit
- Define plan scope

September

- Identify stakeholders
- Methodology research

October

- Gather data layers
- Contact partners and experts

November

- Interview farm service providers
- Map existing conditions

December

- Create HUC-10 profiles
- Write fall semester report

**January
2022**

- Interview community representatives

February

- Develop metric weighting process
- Determine priority areas

March

- Compile priority HUC-12 plan information

April

- Write final plan
- Consult with project partners

May

- Present final plan to the MR WMA

HUC-10 Sub-watershed Profiles

- Purpose: Profile sub-watersheds at the HUC-10 level to provide the MR WMA with an outreach piece and show local issues
- What's included?
 - Reference Map
 - Population and Land Use Characteristics
 - Physical and natural features
 - Waterbody conditions
 - Local issues

Community Interviews

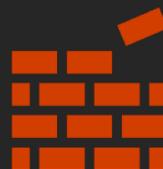

- **Goal:** Contact & interview all 41 communities in the MRW
- **Purpose:** Understand water issues, watershed planning efforts, and willingness to collaborate on future projects
- **Interview topics:**
 - Water management issues facing the community
 - Past & future projects and policies that affect water management
 - Perceptions of watershed planning and importance to the community
- **Outcome:** Provide MRWMA with an understanding of potential project partners and where support or more outreach is needed

Communities we interviewed

- Monticello, Maquoketa, Cascade, Manchester, Dyersville, Bankston, Arlington, Aurora, Epworth, Worthington, Spragueville, Lamont, Preston

Community Interview Results

- Key findings:
 - Interest in projects that benefit recreation and economic development
 - Widespread support for WMA activities
 - Understanding impacts to other communities
 - Abundant water-related assets
 - Extensive water management practices are underway

Farm Service Provider Interview Results

- Interviewed 6 farm service providers from ISU extension, IDALS, NRCS, SWCD
- Results:
 - Confirmed expectations about trends in conservation practices and farmers' willingness to implement new practices
 - Sustained implementation depends on initial success and seeing neighbors' success

Community Interview Questions

Communities

1. How would you describe your community? Thinking of aspects such as demographics, history of development, government structure.
2. What are some assets of the water resources in your community?
3. What water-related issues, if any, have you identified in your community?
4. How is watershed-level planning important to you?
 - a. What would you like to get out of this process?
5. Are you a member of the WMA?
 - a. How involved are you and why or why not?
6. Have you implemented projects within the watershed?
 - a. Did the project(s) focus primarily on flooding, water quality, or something else?
 - b. Were there other benefits to the project (e.g. social, economic, recreational)?
7. Are there any projects that you would like to implement?
 - a. What are constraints?
8. Does your community have any programs or policies on water infrastructure (e.g. stormwater runoff ordinance, retention requirements, or erosion and sediment controls)?
 - a. What was the process like to adopt these? Or why have these not been adopted?
9. As a follow-up, would you be willing to note watershed project ideas of interest to your community on a document that we will send via email?

Community Interviews: Results

Completed and Future Community Projects	
Gains	Constraints
+ recreational trails	- limited city budget
+ levees for flood protection	- technical expertise and cost
+ buyouts of buildings in the floodplain	- community support
+ community amenities	- land, public or able to acquire

Farm Service Provider Interviews

- **Goal:** Interview organizations who work with farmers
- **Purpose:** Understand changes in conservation practice adoption and farmers' perception of conservation practices
- **Interview topics:**
 - Changes in services over time
 - Farmer perceptions and willingness to adopt conservation practices
- **Outcomes:**
 - Understand landscape and potential hurdles for more widespread adoption of BMPs
 - Discover how to market BMPs to farmers that show hesitancy

Farm Service Providers

1. What is your name and profession?
2. How long have you been a farm service provider and why did you choose to become one?
3. What is the role of a farm service provider and what sorts of services do you provide?
4. How have the services you provide changed over time?
 - a. Has the emphasis on conservation practices changed as well?
5. How is watershed-level planning important to you?
 - a. What would you like to get out of this process?
6. How many farms have you worked with in the MRW?
 - a. Are they primarily small-scale farms or large-scale farms? Both?
 - b. Family farms or more agri-business operations?
7. What is your main strategy to market your services?
 - a. i.e. Do you go directly to farmers? Recommended by word-of-mouth? Work as an intermediary between suppliers and farmers?
8. How much do your services cost? How does this compare to average farm expenses?
9. What has the feedback been like from farmers that have adopted BMP?
10. What holds other farmers back from implementing BMP?
 - a. Cost? Traditions? Lack of resources/knowledge?

Farm Service Provider Questions

Farm Service Provider Interviews: Results

Service Provider Focus on Conservation Over Time	Reaction of Farmers who Implement Management Practices	Hesitations of Farmers who have not Implemented Management Practices
<ul style="list-style-type: none">- has always been a focus, but type of practices have changed- 1980s: focus on structural projects (terraces, tiling)- Today: focus on soil health (no-till and cover crops)	<ul style="list-style-type: none">- continuation depends on success of the first try- if successful first year, practices tend to continue- neighbors see successes and start implementing their own practices	<ul style="list-style-type: none">- highly-specific to individual farmers, but general concerns include:<ul style="list-style-type: none">➤ "traditional" farming mindset➤ Cost of implementation or potential yield losses➤ Technical expertise to successfully implement on the first try

Best Practice Research

Prioritizing Phase I Objectives

Goal 1: Improve water quality through techniques for nutrient management, erosion reduction, and increased infiltration

- Objective 1.1: Engage with the agricultural community to encourage techniques that increase field infiltration and reduce soil erosion.
- Objective 1.2: Engage with the agricultural community to reduce and maximize efficiency of agricultural nutrient application.
- Objective 1.3: Encourage practices that slow the flow of urban stormwater to increase infiltration and reduce erosion.
- Objective 1.4: Encourage and increase bacteria management to reduce E. Coli and other bacteria levels.
- Objective 1.5: Encourage and increase the implementation of wetlands to filter water pollutants.
- Objective 1.6: Continue to document and report water quality indicators.

Goal 2: Improve watershed flood management

- Objective 2.1: Advance the mission and goals of the WMA by fostering partnerships between agencies, organizations, and political entities regarding flood prevention and recovery.
- Objective 2.2: Implement a comprehensive program of targeted activities designed to reduce flood risk and improve water quality in the Maquoketa River Watershed.
- Objective 2.3: Increase awareness related to water quantity and strengthen connections between land use management practices and flooding.

Goal 3: Increase watershed awareness and involvement among stakeholders

- Objective 3.1: Educate the local residents to make individual efforts and connections with the watershed.
- Objective 3.2: Ensure all stakeholders in the watershed are included in activities and programs.
- Objective 3.3: Expand WMA network within the watershed through outreach.
- Objective 3.4: Work to achieve an effective interagency corporation with the upriver and adjacent WMAs, the State, the County, the Local Municipalities as well as the Soil and Water Conservation Authorities in the region.

Goal 4: Preserve, protect, and improve ecologically sensitive habitats and ecosystems in the watershed

- Objective 4.1: Prioritize natural resource sites in the watershed for preservation, protection, and restoration.
- Objective 4.2: Protect streambanks, shorelines, and buffer areas within the watershed.
- Objective 4.3: Restore wetlands and riparian areas in the watershed.
- Objective 4.4: Improve habitat conditions for native flora, fauna, and marine lives in the watershed.
- Objective 4.5: Restore floodplain connectivity within the watershed.
- Objective 4.6: Protect source water sites in the watershed.

Goal 5: Establish the WMA as a trusted community resource

- Objective 5.1: Make the WMA representative of the people and interests in the watershed.
- Objective 5.2: Connect communities with resources specific to the watershed.
- Objective 5.3: Recognize and identify vulnerable populations in the watershed that may be affected by poor water quality and flooding.

Decision-Making Criteria
