# Section I Executive Summary

The University of Iowa Senior Design student group is pleased to submit this design report to the City of Bloomfield for the enhancement of the Lake Fisher Recreation Area. The purpose of this project is to expand and improve recreational opportunities within the park through targeted infrastructure upgrades, diversified amenities, and enhanced support for tourism and community use.

Located just west of Bloomfield in Davis County, Iowa, the Lake Fisher Recreation Area encompasses approximately 322 acres of green space, including an 82-acre man-made lake. The park currently provides fishing, boating, hiking, camping, and general outdoor recreation opportunities. The City seeks to build upon these existing features by investing in facilities that promote outdoor recreation, eco-tourism, and community engagement while preserving the ecological integrity of the lake and its surrounding environment.

This Senior Design group, based in Iowa City, Iowa, is a student-led team composed of ten members specializing in various civil and environmental engineering disciplines. Our team's collective expertise includes site development, utility coordination, structural design, water quality assessment, stormwater management, watershed analysis, cost estimation, and architectural visualization. This multidisciplinary background equips us to deliver a resilient, accessible, and environmentally responsible transformation of the Lake Fisher Recreation Area.

To accommodate growing visitor demand, six new energy efficient cabins have been designed for the northwest portion of the park. These units offer both single-family and multi-family lodging options, with several featuring shared patio spaces to support group gatherings. The existing RV Park has been redesigned to improve circulation, capacity, and safety through the addition of pull-through parking spaces. A new RV dump station is included in the redesign. The two existing pavilions were retained, as they were in good condition and could continue to provide visitors with locations to gather. In addition, a new venue suitable for gatherings such as weddings has been proposed for the south end of the lake.

Figure 1.1 Aerial image of Lake Fisher

Recreational amenities have been significantly expanded throughout the site, including a new ADA-compliant trail that encircles the lake. This trail begins at a trailhead located on the south side of the site and directly connects to all major points of interest throughout the park. Fitness workout areas have been incorporated along the trail to provide diverse exercise options, and new gravel biking trails were designed to support both recreation and organized events. Two new beaches—one on the west side and one on the south side—provide swimming and relaxation opportunities, with recommended beach volleyball courts.

Additional recreational improvements include a full basketball court, two tennis courts adaptable for pickleball, and a redesigned softball complex with a new playing surface and expanded spectator seating. A green playground and three outdoor workout areas have been designed along the trail to support youth recreation and physical activity. A two-section dog park, separating large and small dogs, has been incorporated near the tennis and basketball courts and will serve as Bloomfield's only designated dog park. Enhancements to the existing frisbee golf course include added trees and upgraded tee boxes.

*Figure 1. 2 Enhanced recreation area with tennis, pickleball and basketball courts*

Improvements to lake access for boating, fishing, and kayaking were also incorporated. At the existing boat ramp, an expanded parking area improves traffic flow for vehicles and trailers, and the adjacent dock has been updated with multiple mooring stalls for temporary boat tie-off. This will provide easy access for boaters until a larger, more permanent boat ramp can be constructed. Three kayak launches have been strategically located on shores to support non-motorized watercraft. A future boat ramp is proposed near the existing water treatment plant, complete with an additional kayak launch to meet anticipated demand. Enhancements to the existing fishing jetties—including the addition of a fish-cleaning station on the southwest shore—improve shoreline access and convenience for anglers.

To improve visitor comfort and eliminate reliance on portable restrooms, three permanent restroom facilities have been incorporated into the design. One facility is integrated into the pavilion near the existing softball field, another

with shower and laundry facilities is located adjacent to the redesigned RV park, and a third is positioned near the south end of the lake to support trail, venue, and beach users.

Outdoor shower stations were included at each beach. All restroom facilities, along with wastewater from the cabins and RV dump station, will be served by onsite septic systems.

*Figure 1.3 Rendering of the Venue on the south side of the lake*

Environmental considerations played a central role in the design. Erosion control measures have been developed to stabilize the shoreline and reduce wave-induced erosion. A comprehensive stormwater analysis identified high-water levels and flow paths to guide resilient design decisions. Water quality sampling was conducted to identify contaminants of concern within the lake. The planting of wetlands is proposed in the southwest and southeast lake inlets to provide wildlife habitat, support contaminant removal, prevent erosion, and enhance visual appeal. The team also evaluated strategies for managing overpopulated fish species.

To provide the city with current and accurate topographic data of the park, a high-resolution drone-based topographic survey was performed in collaboration with Seiler Geospatial. This survey provided current elevation data to support accurate site design for all trails, structures, and parking lots.

Project implementation is organized into four construction phases.

**Phase One** includes installation of utilities, the restroom and septic system for the existing pavilion, temporary parking improvements at the existing boat ramp, construction of the lake-encircling trail, installation of the west-side dock, softball spectator seating, frisbee golf upgrades, tree planting, erosion control, and fish population management. The estimated cost for the construction of Phase One is \$ 2,114,721.00.

**Phase Two** includes the construction of two cabins, the recreation area and associated parking, the RV park including the dump station, restrooms, and septic systems, establishment of wetlands

and native grasses, one beach, the dog park, and gravel biking trails. The estimated cost for the construction of Phase Two is \$ 2,754,731.00.

**Phase Three** comprises construction of all structures on the south side of the lake, two more cabins, the second beach, improvements to the southwest fishing jetties and addition of the fish-cleaning station, and upgrades to the parking area near the existing west pavilion. The estimated cost for the construction of Phase Three is \$ 1,989,246.00.

**Phase Four** includes the remaining softball field improvements, construction of the permanent east boat ramp, the remaining two cabins, and the workout areas along the trail. The estimated cost for the construction of Phase Four is \$ 1,305,962.00

The estimated total cost of construction for the Lake Fisher Recreation Area improvements is \$8,164,660.00. This total cost includes a 40 percent contingency for each phase because the design provided in this report is a 60 percent design and due to expected unknown complications during construction. A detailed breakdown of this estimate is provided in Section VII of this report.

In addition to this engineering design report, the project deliverables include detailed plan sets, a cost estimate for construction and design services, and a final presentation to stakeholders.

# Section II Organization Qualifications and Experience

## 1. Organization Location and Contact Information

Department of Civil & Environmental Engineering  
University of Iowa  
103 South Capitol Street  
Iowa City, IA 52242

## 2. Organization and Design Team Description

This Senior Design group is a student-led team within the Senior Design Capstone Course. The team consists of ten members specializing in diverse areas of civil and environmental engineering. Areas of expertise include site development, structural design, environmental analysis, utility mapping, cost estimation, and architectural visualization.

Our team is proficient in industry-standard software, including Civil 3D, Revit, HEC-RAS, and RISA3D, to ensure the development of high-quality deliverables. Each member has been assigned a defined role tailored to their area of expertise:

- Carson Merten – Project Manager, Civil/Structural design

Oversees project delivery, including scheduling, design coordination, and client communication. Provides technical oversight in civil and structural engineering design, including site development, utility mapping, structural analysis, and Revit modeling.

- Luke Althaus – Structural Designer

Specializes in structural analysis, modeling, and design of structures. Contributes to overall site layout and integration with civil works.

- David Verastegui – Structural Designer

Provides advanced structural analysis and modeling using RISA3D and Revit to ensure code compliance and structural integrity.

- John Crane – Multi-Disciplinary Designer

Brings a cross-disciplinary background in civil, structural, and environmental engineering. Supports integration across design elements and addresses project needs as required.

- Fernando Carrillo – Civil Designer

Focuses on ADA-compliant trail design, utility mapping, and sited development. Ensures accessibility and compliance with standards.

- Thomas Holzapfel – Civil Designer

Responsible for site development and utility coordination. Provides design expertise for ADA-compliant trails, roads, and parking systems.

- Elise McKee – Environmental Engineer

Contributes to water distribution modeling, stormwater evaluation, environmental impact analysis, and utility coordination.

- Kristin Stein – Environmental Engineer

Specializes in water quality assessment, erosion control strategies, and preparation of environmental documentation.

- Dylan Seiffert – Environmental Engineer

Assists with environmental sampling, design of water distribution systems, and the integration of sustainable engineering practices.

- Idris Kecira – Architect, Structural Designer

Produces architectural renderings and visualizations aligned with engineering designs. Provides support for structural analysis and design documentation.

## Section III Design Services

### 1. Project Scope

The City of Bloomfield has partnered with the team to enhance the Lake Fisher Recreation Area, located just west of Bloomfield, Iowa. In response to this request, the team designed new cabins, boat ramps, recreational areas—including playgrounds and sports courts—trails, restrooms, a dog park, and an expanded RV park. These improvements also created a need for a comprehensive stormwater runoff model, water quality control initiatives, erosion management strategies, and septic system design. The team has taken on each of these tasks and provided the following summary of work.

*Figure 3.1 Site layout showing all major elements included in the scope*

A total of six cabins were designed, each containing two bedrooms. The cabins were developed for multi-use purposes such as family gatherings, hunting lodging, or weekend getaways. Design

considerations included foundational design, structural analysis, and aesthetics. In addition, year-round use was considered as requested by the City.

The park's two existing pavilions were maintained in the final design. To improve accessibility, an expanded parking area was added near the northernmost pavilion adjacent to the proposed recreation area. Additionally, an attached restroom has been designed for the existing pavilion near the softball field, along with another expanded parking area at that location. Per the City's request, a dedicated venue space was added at the southern end of the lake to accommodate large family events, gatherings, and weddings. This venue was not included in the original scope of services but will act as a nice addition to further enhance the use of the park.

The City has requested improvements to the existing boat ramp. The team first recommends increasing parking at the existing ramp to accommodate the expected increase in visitors to the lake. This existing boat ramp will continue to be used until the adjacent abandoned water plant is demolished. Following demolition of the water plant, that area will be utilized for the construction of a larger and more accessible permanent boat ramp and dock. Docks with kayak launches have been proposed at three locations around the lake to accommodate non-motorized vessels.

To attract families and younger visitors, new recreational amenities were designed for the northwest side of the lake. These include two multi-use sport courts striped for tennis and pickleball, as well as a full basketball court. Additionally, green playgrounds—play areas that incorporate natural materials and elements—were designed at the City's request to encourage outdoor physical activity and learning for young children.

To further improve recreational opportunities, a new accessible trail system around the lake was developed, with a trailhead located on the south side of the lake. The trail meets all Americans with Disabilities Act requirements and adheres to SUDAS standards. It was intentionally routed to create connectivity between all major site features and can be used for walking, running, and biking. Following discussions with the client, three outdoor workout areas were added along the trail to promote additional physical activity. Although not part of the original project scope, these features strengthen the recreational value of the site. In addition to the Class A compacted stone pathways, gravel biking trails were also included to provide an alternative option for visitors.

Improvements were also made to the existing RV park. The design expands the area to accommodate ten RVs, adds gravel pads for stability, and provides adequate space for vehicles to safely and comfortably turn around.

Northwest of the lake, a new dog park has been designated. The space includes separate areas for small and large dogs, each equipped with prefabricated dog playground equipment. Recommendations for equipment providers were specified.

As a result of the planned development, stormwater runoff must be modeled and compared to the pre-development conditions. The team carried out models for the one year to 500-year storm to understand the flood risks and potential impacts of different storm events. Additionally, the NRCS method was utilized to estimate peak flows and develop hydrographs at the outlet point of the lake. This information was taken into consideration when implementing erosion control features.

Due to the expected larger volume of runoff entering the lake after development, preventative erosion control features were implemented into the design. Additionally, measures were taken to improve the significant existing erosion issues on the southern shoreline of the lake. Such features include the planting of native species in the area and implementation of rip rap to stabilize the soil.

Ensuring safe swimming, fishing, and water sports is a primary goal of the Lake Fisher Recreation Area improvements. To protect recreation and ecological health, the team evaluated the lake's existing water quality, testing contaminants such as industrial chemicals, pesticides, and nutrients including nitrogen and phosphorus. In response to identified concerns, watershed management practices—such as native plantings and constructed wetlands—were recommended to improve long-term water quality.

To accommodate the expected increase in visitors, three restroom facilities were included in the design. Two will be located on the northwest side of the lake to serve park users, while the third, located on the south side, will support guests using the venue. Showers and a small laundry facility with two washers and two dryers were also added to the RV Park Restrooms for multi-day visitors.

Waste generated from restrooms, RVs, laundry machines, showers, and cabins will drain to septic tanks. The design for Lake Fisher includes five separate septic tanks and associated leach fields. All sizing criteria, material specifications, and leach field size calculations for the septic tank were done according to Iowa Administrative Code 567 Chapter 69.

In the final stages of design, all necessary potable water and septic piping were incorporated into the engineering drawings. Iowa codes and standards guided decisions on pipe diameter, material, and slope. Existing underground utility maps provided by the City were also utilized to avoid conflicts with existing infrastructure.

## 2. Work Plan

Figure 3.2 Summary of work completed by the team

# Section IV Constraints, Challenges and Impacts

## Constraints

Several notable constraints were present in this project. One constraint encountered during the trail design and site layout process was the presence of the City's designated burn yard located within the project area. This area is used periodically for controlled burning of vegetation and debris, producing smoke that can be a nuisance to individuals in the area. Due to the unpredictable timing, duration, and intensity of these burns, the trail alignment and beach location had to be intentionally routed away from this zone to ensure public safety and reduce the likelihood of negative impacts on visitors and the environment.

Another important constraint was the property line along the northwest corner of the project site. This portion of the site was intended to be developed more heavily; however, the property boundary directly abuts an active gun club. Due to this limitation, the design team had to condense several planned features—including the recreation areas with basketball and pickleball courts—into a much smaller footprint than originally envisioned. This required careful spatial planning to ensure safety, maintain adequate separation between activities, and still provide functional, high-quality amenities within the restricted space.

A further constraint was the need to maintain ADA compliance across all components of the park. Ensuring accessible routes, appropriate slopes, compliant surfaces, and inclusive access to amenities required careful coordination throughout the design process. These requirements influenced trail grading, ramp locations, recreation area layouts, and beach access features, ensuring that all visitors—regardless of mobility—could safely and comfortably use the park.

The final constraint was the preservation of the existing pavilion. Constructed by the local Amish community, the pavilion was valued for its craftsmanship and cultural significance. Rather than removing it, the project was constrained to make additions and modifications while maintaining the original structure. This requirement influenced the surrounding layout and design decisions, ensuring that new features integrated seamlessly with the existing pavilion without compromising its integrity or character.

## Challenges

Grading throughout the site presented another notable challenge. The lake lies moderately below much of the existing grade, making it difficult to provide safe and functional connections to the waterfront. Ensuring that all trails, ramps, and access points complied with ADA requirements

while accommodating the significant changes in elevation required careful planning and design. The grading strategy needed to balance accessibility, safety, and site stability, while also integrating seamlessly with surrounding trails, recreation areas, and beach access points.

In the northwest portion of the site, the presence of the Isaac Walton Shooting Range introduced an additional challenge for the placement of several planned recreation amenities, including the proposed dog park. Regular firearm activity at the range has the potential to create elevated noise levels and intermittent disturbances, which could negatively impact the experience of park users in this area. To mitigate these concerns, the design incorporates strategic tree plantings intended to function as a natural sound buffer, reducing both noise transmission and visual exposure to the range. While these plantings do not eliminate the issue entirely, they provide a practical and sustainable measure to improve user comfort and enhance the overall suitability of the northwest corner for recreational use.

Designing the waterfront structures posed an additional challenge due to fluctuating water levels. The bank-full elevation was 820 ft, while the design low water elevation was 818 ft, requiring careful consideration to ensure usability across this range. All docks, boat ramps, and beach areas were designed to accommodate both high and low water conditions while maintaining ADA-compliant access. This required precise elevation planning, structural adjustments, and material selection to ensure that all visitors—regardless of mobility—could safely and comfortably access the waterfront under variable water level conditions.

The addition of several new structures with restroom facilities introduced a challenge related to the placement of septic systems. Each structure required a septic tank and associated leach field, which could not interfere with existing structures or site features. Furthermore, the size of the leach fields imposed additional constraints, as no buildings, trails, or other improvements could be placed on top of them. Careful coordination of structure locations, utility layouts, and surrounding site elements was necessary to ensure proper system function, maintain regulatory compliance, and avoid conflicts with existing amenities and infrastructure.

## Societal Impact

An important societal consideration for this project was the unique demographic composition of the community, which includes a significant Amish population. To ensure the recreational facilities serve all residents equitably, the design intentionally incorporates features that support their customary modes of transportation and park use. This includes providing adequate hitching posts as well as shaded areas and accessible water sources for horses near key gathering points. Because the Amish community frequently utilizes the softball complex and often attends games in

large numbers, additional spectator seating was also incorporated into the design to accommodate these gatherings comfortably. These enhancements not only improve accessibility and usability for Amish residents but also foster inclusivity and strengthen the park's role as a shared community space.

Due to the project being located within a smaller community with limited financial resources, careful consideration was given to the long-term affordability of the proposed improvements. To ensure the City can implement the design without exceeding its available budget, the project was intentionally organized into clearly defined phases. This approach allows the community to prioritize essential elements first, while deferring more discretionary features until additional funding becomes available. By structuring the work in manageable stages, the design supports responsible fiscal planning, maximizes the impact of local investment, and provides the flexibility needed for the City to continue enhancing the park as resources permit.

During the evaluation of existing site amenities, it was determined that the current shelter structures remain in good condition and continue to serve the needs of park users effectively. Although the City expressed openness to potential renovations, the design team elected to retain the shelters in their present form—aside from the planned addition of a restroom facility at the softball shelter—in order to minimize unnecessary costs and maintain the functional integrity of the existing buildings. In doing so, the project also subtly honors the craftsmanship of the Amish community members who originally contributed to the construction of the pavilion near the softball field. Preserving these structures acknowledges their role in shaping the park's history and reflects an appreciation for the traditional building methods that have long supported recreation in the area.

# Section V Alternative Solutions That Were Considered

## 1. Site Layouts

To ensure a clear understanding of all team and client perspectives, the team was divided into three groups, each tasked with developing an alternative site layout. This approach allowed the team to explore multiple configurations that addressed the client's requirements while considering existing site constraints. Within each group, the placement, dimensions, and quantities of the requested features were discussed. Following this, the team held an internal design review and a subsequent meeting with the client to evaluate the advantages and limitations of each alternative. Figures 5.1, 5.2, and 5.3 present the layouts submitted by each group for internal and client feedback.

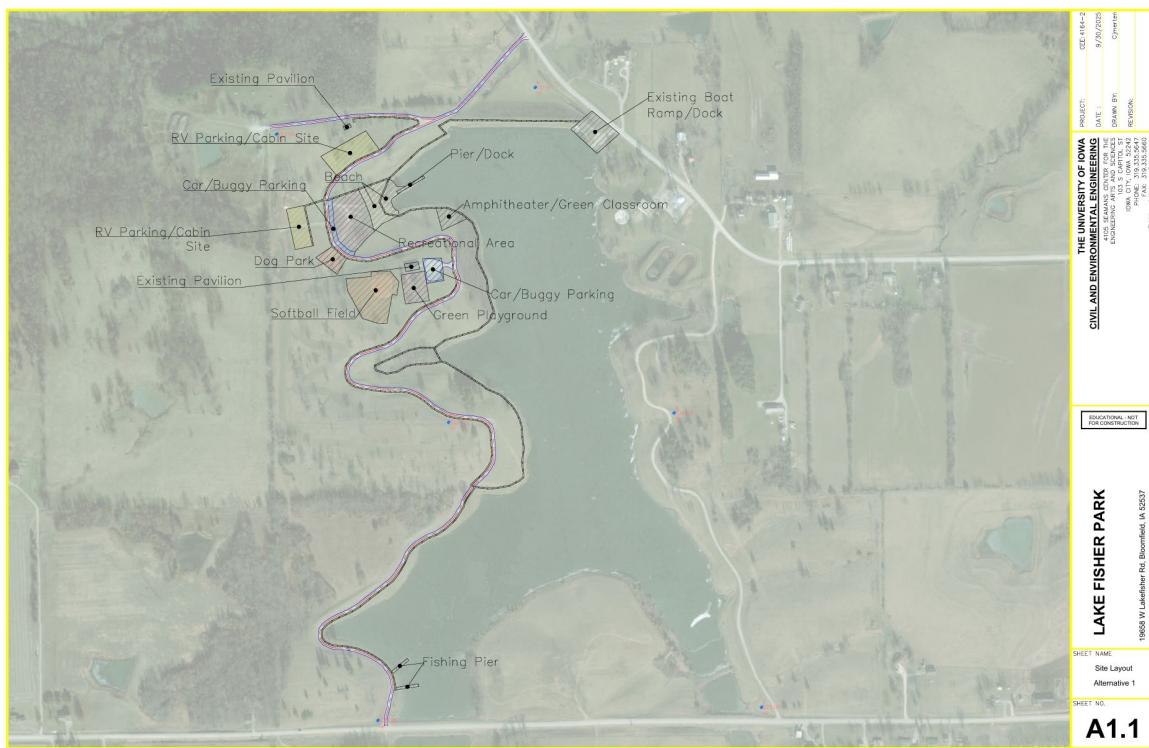

Figure 5.1 Layout alternative 1

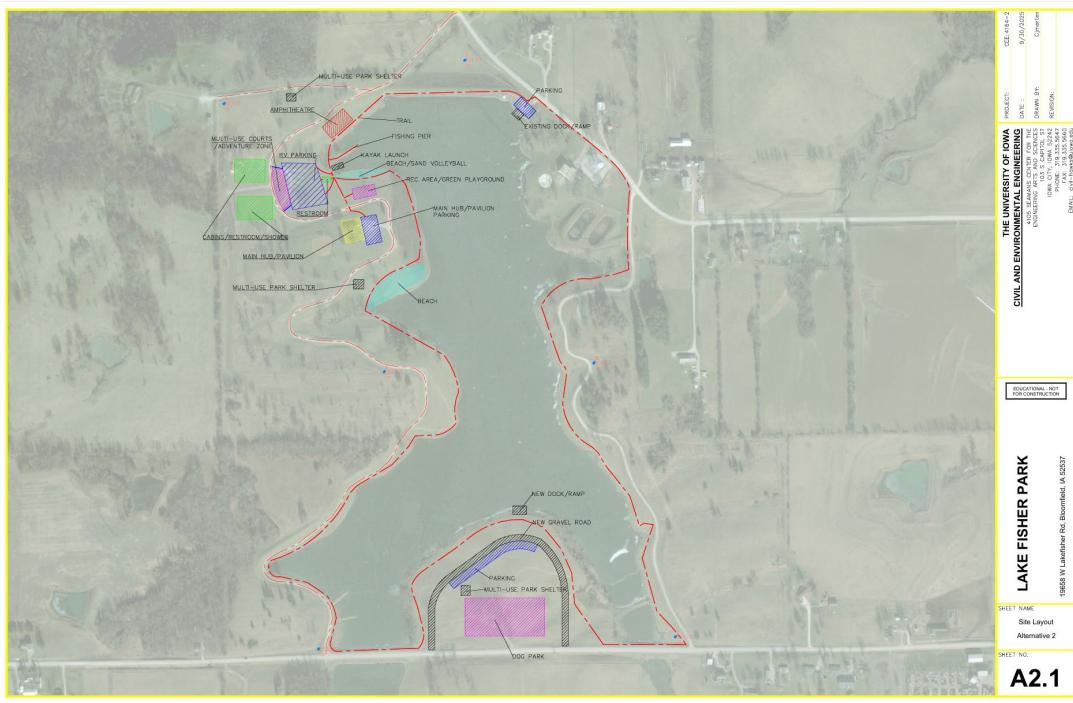

Figure 5.2 Layout alternative 2

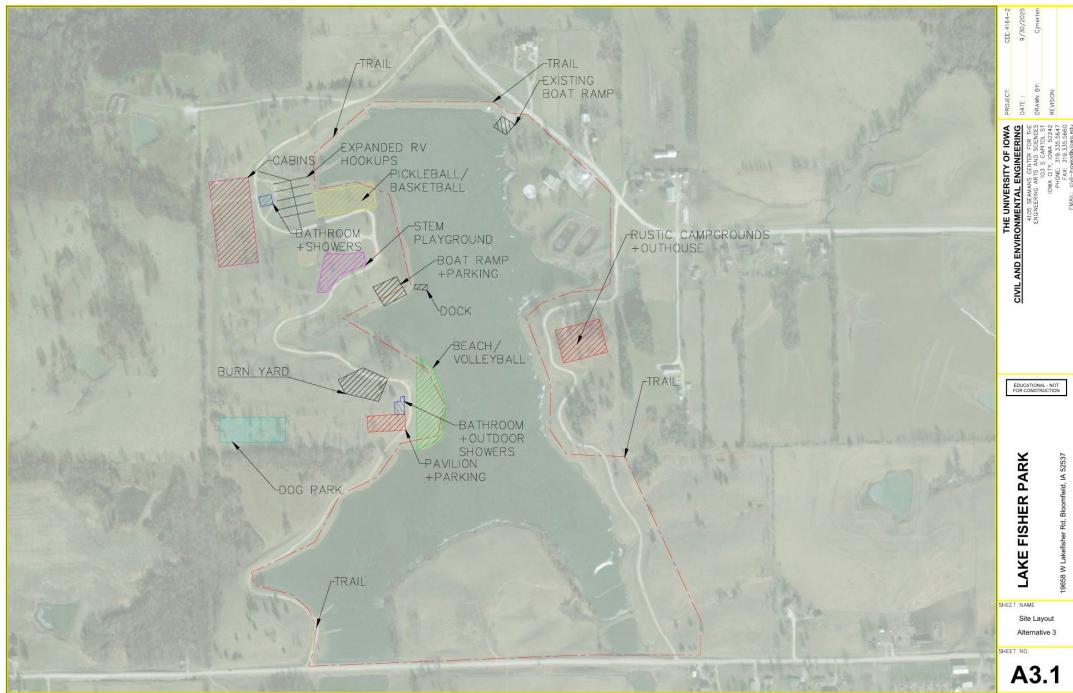

Figure 5.3 Layout alternative 3

Following both internal and client feedback, the team was able to refine the design in a more targeted manner to meet the City's requests while remaining within the site's constraints.

The team and the City agreed that the majority of the design should focus on the northwest portion of the park. This area proved to be the most versatile, accessible, and spacious portion of the park. Alternative 2 was the only concept that incorporated the southernmost end of the site; this area was initially considered for a dog park but was later revised to a venue in response to the City's input. Alternatives 2 and 3 also proposed extending the trail to the east side of the park, a feature that was further refined in the final design despite fewer amenities being placed on the east side.

An additional consideration for all groups was the existing burn yard on the west side of the site. Because the burn yard may be active two to three times per month during peak periods, park features in that area were intentionally limited to avoid conflict with operations.

Once a general layout was agreed upon internally and with the client, the design team advanced the level of detail for each site feature. Tasks were assigned to team members based on technical expertise and workload, with some features requiring collaboration from multiple designers. Team members responsible for interdependent features coordinated regularly to ensure consistent design assumptions across the site. The specific considerations for each feature and the corresponding engineering analyses are detailed in Section VI.

## 2. Cabins

*Figure 5.4 A Frame Trio 100 A-Frame Cabin*

In considering designs for the cabins, initial ideas included “A-Frame” or log cabin structures, but their designs were ultimately less versatile than a typical stud wall construction which contractors are more familiar with. This reduces cost, construction waste, and build times. A more standard design also allows us as designers to focus on optimizing other facets of the cabin design, notably the energy efficiency of each residence which would allow them to operate into the cold winter months efficiently and at minimal cost to the operator.

*Figure 5.5 Southland Log Cabin*

A two-bedroom design with a joined kitchenette and living room was selected for its appeal to both families as well as hunters who would be renting out these cabins. This design balances a need for privacy without significantly reducing square footage and giving renters access to the basic amenities that one might expect when staying multiple days away from home.

Lastly, for a platform framing system of trusses supported by stud walls over a wood frame floor with a crawl space was selected for its resistance to wear incurred by the freezing and thawing ground as well as for its capacity to serve as storage space for the park should that be necessary.

### 3. Venue

During the design phase, multiple location and structural concepts were evaluated for the proposed venue. The initial concept envisioned an amphitheater with a semi-circular configuration and a scenic backdrop. This design was considered well-suited for presentations, performances, and concerts. However, following client input, the focus shifted from an amphitheater to a more traditional venue structure. The amphitheater had originally been planned near the recreation area, positioned along the lakefront to take advantage of the natural setting. While this location offered aesthetic appeal, it was later identified as a potential site for a septic system or leech field required for the recreation area restrooms. This constraint necessitated reconsideration of the location. Subsequently, the design transitioned to an open-air style venue, relocated to the south peninsula. This placement provided a distinct feature within the park while maintaining separation from the recreation area, thereby establishing the venue as a stand-alone facility dedicated to hosting events. The amphitheater concept had incorporated a concrete half-bowl structure to enhance acoustics, but its lack of a roof presented significant limitations. Events would have been vulnerable to weather disruptions, and the proximity to the lake introduced potential flooding risks. In contrast, the revised venue design features a flat, roofed structure constructed on elevated ground, effectively mitigating these concerns and ensuring greater reliability for year-round use. All proposed concepts were carefully measured and reviewed to confirm spatial feasibility, optimize land use, and align with the client's requirements.

### 4. Restrooms

A restroom design for the RV Park restroom first included a shower area connected directly to the main restrooms. This design was changed to separate shower and restroom areas. Changes were made due to the desire to lock the shower area separate from the restrooms, allowing only the users of the RV park to have access to the showers. Along with that, the first design did not include an area for laundry. To further incentivize visitors to the RV park, a laundry area has been included in the design to increase convenience. Lastly, the utility room was made larger and more centralized. A centralized utility room gives the largest buffer between mechanical equipment and the elements. Preventing utility failure as well as reducing maintenance costs. To increase the amount

of green and sustainable infrastructure on site, solar panels were added to the restrooms. This necessitated a larger mechanical room to house the equipment.

## 5. RV Park

The main goal was to expand the RV park while keeping it easily accessible. The first iteration included a central through-lane and added additional lanes on each side. These new lanes were set at a 45-degree angle relative to the main through-lane. Initially, all angled lanes faced the same direction; however, this would have required one-way traffic through the park.

To resolve this, the lots were reoriented, to opposite directions on either side of the through-lane. The central through-lane was extended and new through-lanes were added along both sides, ensuring full accessibility throughout the expanded layout.

## 6. Trails

Initially, the trail was located only on the west side of the site, as no development was planned on the east side. One of the first major revisions made was to have the west-side trail branch off to connect directly to the existing shelter and then run along the road to serve the recreation areas. The trail was also rerouted to pass through the land bridge on the southeast side of the site, and it was shifted closer to the lake on the east side.

Once development on the east side was confirmed, we redesigned the trail network to allow users to walk, run, and bike around the entire lake, creating a continuous loop. A branch on the west side was added to provide direct access to all major site features, reducing the need for users to drive and park. The idea to route the trail through the land bridge originated from the client, and a subsequent site visit confirmed that this was feasible. Initially, the trail had been aligned to cross the existing road on the southeast side based on an aerial image that showed what appeared to be a mowed path, which was assumed to be a trail. A site visit revealed that this was a corridor for electrical poles and that the adjacent slopes were quite steep, making ADA compliance difficult. As a result, the alignment was shifted closer to the road and lake, where grades were more manageable.

## 7. Boat Ramps and Docks

The boat ramp and dock facilities underwent numerous design iterations throughout the project. The initial concept focused on replacing the existing dock with an upgraded structure while leaving the current boat ramp unchanged, as it had recently undergone maintenance. However, after meeting with the client, reviewing alternative concepts, and conducting the team's own site assessment, it became clear that providing multiple access points would better serve the lake. Early alternatives included adding a single dock on the west side of the lake near the existing

parking area. As the project evolved and the southern portion of the lake was identified as a suitable location for a venue and trailhead, the associated utility requirements ultimately guided the development of the current dock layout. Additionally, a dock was incorporated into the north fishing jetty to provide convenient access for the nearby cabins and RV sites.

Several dock design alternatives were evaluated over the course of the project. Initially, pile-supported docks were considered, but the team ultimately shifted toward a floating dock system. This option offered greater flexibility and aligned with the client's preference for a low-maintenance solution. Temporary pole-anchored floating docks were also explored as an alternative; however, this option was dismissed due to the need for recurring winter removal and maintenance.

For much of the project timeline, the existing boat ramp was deemed adequate and was not scheduled for modification. This changed when the client informed the team that a significant portion of infrastructure on the east side of the lake would be removed. This includes a decommissioned water treatment plant with two unused lime pits. This created an opportunity to design a larger, more functional boat ramp with increased parking capacity and improved turning radii to better accommodate vehicles towing large boats.

## 8. Beaches and Sand Volleyball

The beaches underwent numerous revisions over the course of the project. The initial plan featured a single beach on the lower west side of the lake; however, the client noted that smoke from the nearby burn pit frequently affected this area. To address this concern, the team explored relocating the beaches further north to avoid smoke and provide closer access to the parking area. A second beach on the south side of the lake was also considered to promote increased activity in that area. These iterative alternatives ultimately informed the development of the final beach design.

The design process also considered the lake's low water level, which required significant grading. Early concepts included a retaining wall to manage the elevation difference, but by adjusting the trail alignment down to the beach, the need for stairs or a retaining wall was eliminated. Various amenities were debated, including full showers and restrooms, but the final plan incorporated only a small beach shower. Similarly, sand volleyball was initially considered for removal due to space constraints from grading, but the design was modified to accommodate the volleyball area. These successive iterations reflect the project's exploration of alternatives before arriving at the final, functional beach layout.

## 9. Recreational Area

In the initial concept, the team planned for three full-size basketball courts and six pickleball courts, all located on the west side of the site. After confirming the projected number of users, the number of courts were reduced to better match demand and create a more efficient use of space. The design was revised to one full-size basketball court and two courts designed to function as both pickleball and tennis courts. To keep the cabins more secluded and preserve a quieter setting for overnight users, the positions of the rec area and the cabins were swapped, moving the recreation facilities away from the cabins and closer to other active-use areas on the site.

## 10. Dog Park

The dog park was originally planned as a single large area on the south side of the site, on the peninsula where the trailhead parking is now located. After further consideration, the dog park was relocated to the northwest portion of the site, closer to the main cluster of development, so users can access more amenities within a concentrated area. The dog park was also divided into a larger area and a smaller field to give owners options based on their dog's size and comfort level.

## 11. Workout Areas

The workout areas were originally conceived as a single pad with four pieces of equipment manufactured by Kompan, located next to the shelter on the west side to complement the other recreational amenities and the green playground.

After receiving client feedback, this concept was expanded from one workout area to three, and the locations were adjusted to better align with the trail network. This allows visitors to use exercise equipment conveniently while walking or running through the site and creates a more versatile and accessible fitness experience. The design team also focused on incorporating more calisthenics equipment, which supports more social interaction and efficient usage of the space. These changes were made to better support the City's goal of increasing activity options and social gathering areas for young people.

## 12. Green Playground

Time was spent researching, initially, as there was a need to find a dependable playground equipment manufacturer and designer that fit the criteria of the City. The main criteria were that it implemented natural elements into the aesthetics and material of the equipment, and that it promoted learning opportunities for children. We had considered a common design incorporating a mostly metal swing set and tower following the already existing layout, but more specialized manufacturers were researched to fully realize the client's vision.

Natural Playgrounds Company, a playground design company that does work across the United States providing wood playground features, was contacted. This manufacturer was selected based on the level of safety their products provide by meeting all ASTM, CPSC, and licensing requirements. Their designs also possess the educational element that the client was looking for.

A preliminary playground design was then developed to receive a quote on their services. The design involves 2 pads to incorporate features for both physical activity and learning separately. Considerations and alterations made to the playground design were based on the placement of features in relation to each other to avoid intersecting fall zones. A minimum of 6 feet of space in all directions was provided for features that could potentially cause injury.

## 13. Stormwater Analysis

To decide how to evaluate the lake and watershed area affecting the lake, USGS StreamStats was used. In this application, there were many locations that could be selected as the watershed outlet. Figure 5.4 below is an example of the different watersheds that could be used to break up one larger watershed for the area draining into the lake.

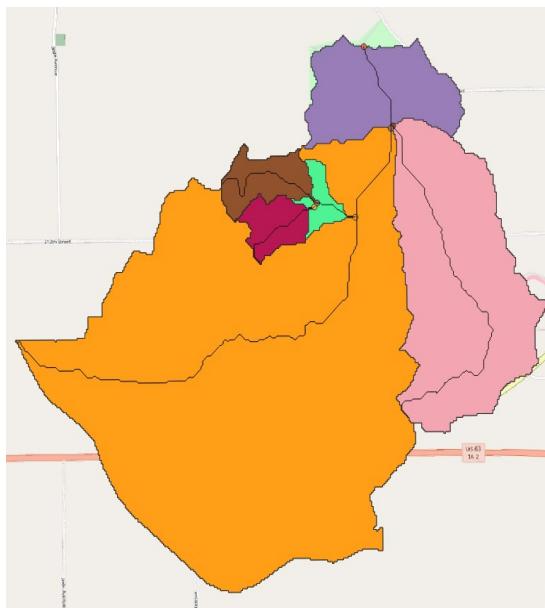

Figure 5.4 6 Site subwatersheds

To get an accurate representation, the lake must not be considered as a part of the watershed, because the flow through the lake is generally much slower than on land as well as there is a specific outlet device in the lake that limits the outflow. It was decided that one single watershed

should be used for this evaluation, and the lake area will be eliminated from it for all area, slope, and longest flow path calculations resulting in the watershed shown in the Final Design Section VI.

The two main options—the NRCS Storm Data and NOAA Atlas 14—were considered as resources for gathering storm data. The NRCS Storm Data can be specified by selecting a county, and the NOAA Atlas 14 data is specified by selecting a rain gauge. It was found that there is a rain gauge on the Fisher Lake Recreation Area site shown below in Figure 5.5.

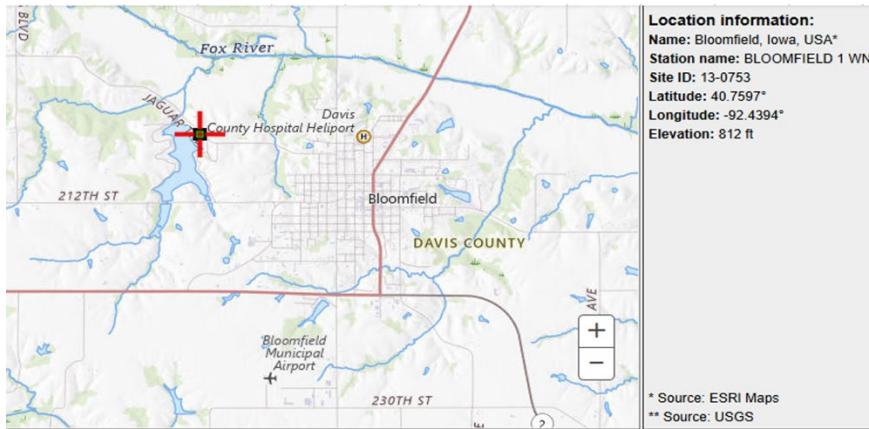

Figure 5.5 7 NOAA Atlas 14 rain gauge location.

Due to the proximity of the gauge to the site, it was determined that this resource would be the most accurate for use in modeling.

The final major determination to be made for the stormwater model was the dimensions of the outlet structure shown in Figure 5.6.

Figure 5.6 8 Existing outlet structure.

It was assumed that the top of the outlet structure is at an elevation of 820ft, the same elevation as bank full. It was estimated that the height of the outlet from the top to the top of the inlet weir is 2ft, meaning that the permanent pool of the Lake is located at 818 feet of elevation. It was also estimated that the two sides of the inlet start as a two-sided weir 3ft long on each side, with 2ft between the sides. Then, once the water rises to 820ft, the left and right sides are engaged and are 6ft long each. The discharge pipe is 3ft in diameter. These assumptions were used to calculate the discharge of the structure for each elevation from 818ft to 840ft.

## 14. Erosion Control

When determining potential alternatives for erosion control, chapter seven of the Iowa SUDAS Design Manual was consulted. Alternatives such as compost blankets and filter berms were considered. However, due to the temporary nature of such solutions, it was determined that native wildflowers and rip rap erosion control measures were most suitable for the site.

## 15. Water Quality Analysis

During the early phase of design for this project, it was discussed that taking several samples on different days at sampling locations throughout the lake would be helpful to develop average constituent concentrations within the lake. With the knowledge that the Iowa Department of Natural Resources was performing a complete, multi-year study on the watershed and the lake itself it was determined that sufficient data would soon be available to draw conclusions on the water quality within the lake. Thus, the six samples were collected at various locations surrounding the lake for the purposes of comparison to IDNR data.

## 16. Wetlands

A complete constructed wetland was initially considered to assist in pollutant removal. The original design was to include microtopography to increase biological uptake of pollutants by plants, increase the time of concentration, and decrease flow velocity. Following the evaluation of the current sediment forebays, the outlet structures on the south road, and the variability in lake depth south of 212<sup>th</sup> Street on the SW side of the lake it was determined that a complete constructed wetland design was not feasible. A similar situation was encountered on the SE side of the lake. Thus, it was determined that a smaller area of wetland plants could be planted on the SW and SE inflow areas to protect against erosion, provide habitat, assist in pollutant reduction, and enhance the area visually. This option was determined to require a lower cost, less maintenance, and decreased access requirements while still providing the same benefits, however to a lesser degree.

## 17. Septic Tank Design

The original design included three septic tanks. However, it was realized that the resulting leach fields were too large to fit into the allotted space, it was concluded that five septic tanks would be necessary. Each of the five septic tanks has an associated leach field. As nothing can be constructed on a septic tank or its leach field, the team determined that these areas can be used to plant native grasses and wildflowers, which help to improve ecosystem health, soil health, and beautification of the area.

## 18. Fish Population

After communicating with the City to determine their goals in terms of the lake's ecological health it was determined that several fish species were negatively impacting the health of both the lake and the more desirable fish species. The initial solution to this issue was to recommend physical removal of the species negatively impacting the lake and stocking a greater number of predator species which are more desirable to anglers. Following communications with the IDNR, it was determined that a complete removal of all fish species within the lake by chemical means would be optimal. This would be followed by a restocking of desirable fish species and allowing several years for the populations to rebound.

# Section VI Final Design Details

## 1. Watershed and Stormwater Evaluation

The Fisher Lake Recreation Area sits inside a 1,422-acre (2.2-square-mile) watershed. Any rain that falls in this area eventually drains into Lake Fisher and then out through the main spillway. Figure 6.1 shows how water flows downhill from the highest points (yellow) to the lowest point at the lake (blue).

Not all rain makes it to the lake as some soaks into the ground. This process, called infiltration, helps protect the Recreation Area and the dam by reducing how much water reaches the lake during storms. How much water infiltrates depends on the type of soil and how the land is being used.

The watershed contains three soil groups—B, C, and D—which differ in how well they absorb water. Group B soils absorb water the best, while Group D absorbs the least. Their locations are shown in Figure 6.2 using data from the USDA's Web Soil Survey. Water surfaces (red) have no infiltration.

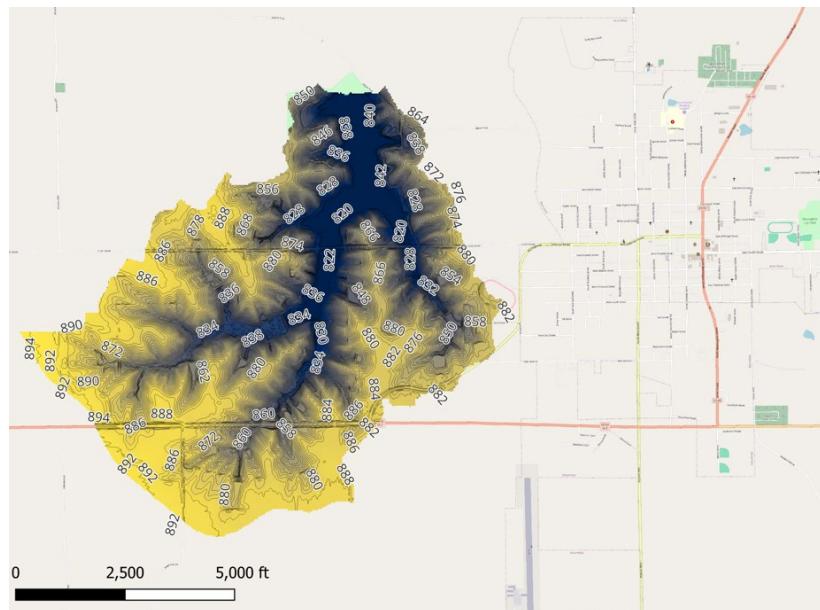

Figure 6.1 Watershed flow paths.

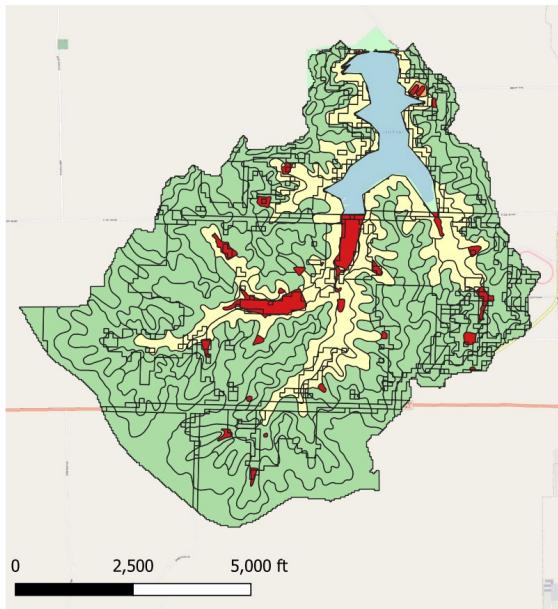

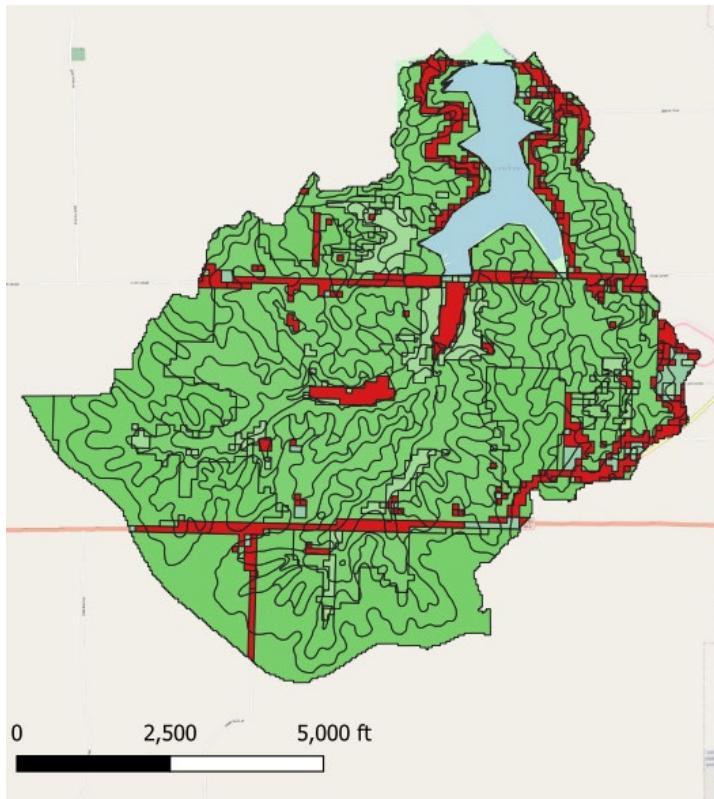

Figure 6. 2 Watershed Hydrologic Soil Groups

Land use also affects how much water runs off. The watershed includes farmland, pastures, roads, small reservoirs, homes, grasslands, and wooded areas. This information was provided by the Multi-Resolution Land Characteristics Consortium. Hard surfaces like roads, houses, and concrete don't allow much infiltration, while fields and grasslands absorb water well. These areas are shown in Figure 6.3 (red = poor infiltration, green = good).

Soil type and land use are combined to calculate a curve number (CN) for each small section of land. A weighted average of all these values gives one CN for the whole watershed: 83.68. This number was used in stormwater models to estimate how much rainfall becomes runoff and how much soaks into the soil.

Another important value is the time of concentration, which is how long it takes water from the farthest point in the watershed to reach the Lake. Using USGS StreamStats, the longest flow path was found to be 9,660 feet and shown in Figure 6.4. Using the Kirpich method and the slope from StreamStats, the time of concentration is 61.6 minutes. This converts to a lag time of 36.97 minutes, which is needed

for HEC-HMS modeling.

Figure 6. 3 Watershed land use

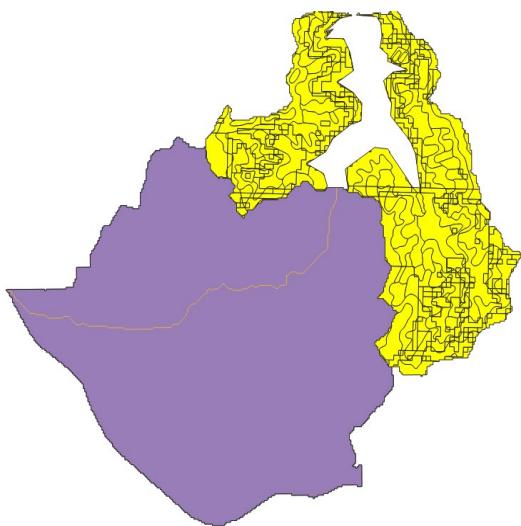

Figure 6. 4 Watershed longest flow path

HEC-HMS is software used to estimate how much water flows into and out of the lake during storms. It uses information such as watershed area, curve number, lag time, lake storage curves, spillway flow curves, the base lake level, and rainfall for the design storms. More details are in Section V and Appendix J.

Storms ranging from the 1-year, which has a 100 percent chance of happening per year, to the 500-year, which has a 0.2% chance of happening per year, were modeled. NOAA Atlas 14 was used to obtain the precipitation depths for a typical 24-hour storms for each design year. The 1- and 2-year storms stay within the Lake's banks. The 100-year storm must safely pass through the spillway, and the 500-year storm is used to test the limits of the system.

The most important outputs from HEC-HMS are the peak inflow, peak outflow, and the highest water level the lake reaches during each storm. These values are compared to existing ground elevations and to planned site features to understand potential impacts.

The team also compared pre-development and post-development conditions. The planned project adds 8.0 acres of gravel and 0.88 acres of concrete, slightly raising the curve number from 83.68 to 83.73. This small increase is within typical model uncertainty but does mean slightly more runoff will occur. Both conditions were modeled for completeness.

To combat the increase in curve number, and therefore runoff, there are multiple elements that can be added. The one considered in this proposal is planting native grasses and plants as well as adding trees. This increases the infiltration of the soil on and around where these plants are planted by restoring the landscape, and because the plants also use the water through their roots. The areas the team decided to add these plants are the leach fields for the septic tanks, as regulations state that no structures can be built on it, and the disk golf area, since adding trees was requested by the City and it adds more difficulty and interest to the course. By planting native plants, the area planted will reduce in curve number by 5, and by planting trees, each 100 ft<sup>2</sup> surrounding each tree will reduce in curve number by 10. The proposed added plants result in a new curve number of 83.72. This is a 0.01 reduction from the post-development curve number and could easily be reduced more by planting more native plants and trees. However, this reduction is again well within the model uncertainty.

It was found that the post-development watershed conditions are almost identical to pre-development conditions. A comparison of the model results is shown in Table 6.1. Overall, the added development does not increase the peak flow into the lake or the peak water level, which are key factors for preventing downstream flooding and protecting the dam.

*Table 6. 1 Pre- and post-development Inflows, outflows, and Peak Elevation*

|                  | Design Storm | Peak Inflow (cfs) | Peak Discharge (cfs) | Peak Lake Elevation (ft) |
|------------------|--------------|-------------------|----------------------|--------------------------|
| Pre-Development  | 1-yr         | 981.2             | 43.3                 | 819.5                    |
|                  | 2-yr         | 1286.6            | 49.6                 | 820.0                    |
|                  | 10-yr        | 2369.5            | 66.9                 | 821.6                    |
|                  | 100-yr       | 4470              | 89.9                 | 824.5                    |
|                  | 500-yr       | 6187.6            | 103.9                | 826.7                    |
| Post-Development | 1-yr         | 983.7             | 43.3                 | 819.5                    |
|                  | 2-yr         | 1289.3            | 49.6                 | 820.0                    |
|                  | 10-yr        | 2372.7            | 66.9                 | 821.6                    |
|                  | 100-yr       | 4477.4            | 89.9                 | 824.5                    |
|                  | 500-yr       | 6200.9            | 104                  | 826.7                    |

For reference, the lake banks sit at an approximate elevation of 820 ft, and normal water level is approximately 818 ft. Based on the contour mapping in Figure 6.5, the southwest road is at elevation 824 ft, and the southeast road and dam embankment are at 828 ft.

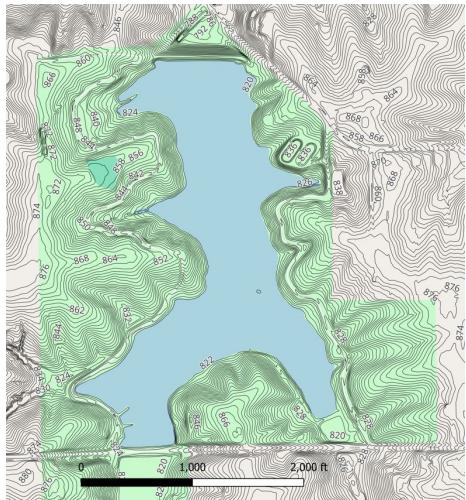

Figure 6. 5 Site contour map

As shown in Table 6.1, the 1- and 2-year storms keep water within the lake's banks before and after development. During the 100-year storm, the water level rises high enough to cover the southwest road, but it is still safely passed through the existing outlet with no risk of overtopping the dam. Even with the 500-year storm event, the lake and outlet structure perform well, with a peak water level of 826.7 ft, which is still 1.3 ft below the top of the dam and the southeast road.

With the proposed improvements implemented, the peak inflow of water into the lake does increase slightly. This makes sense, as the increased impervious area is preventing the current amount of rainfall from absorbing into the soil, and this rainfall is instead entering the lake. The exact increase in percentage and cfs is show in Figure 6.6 below.

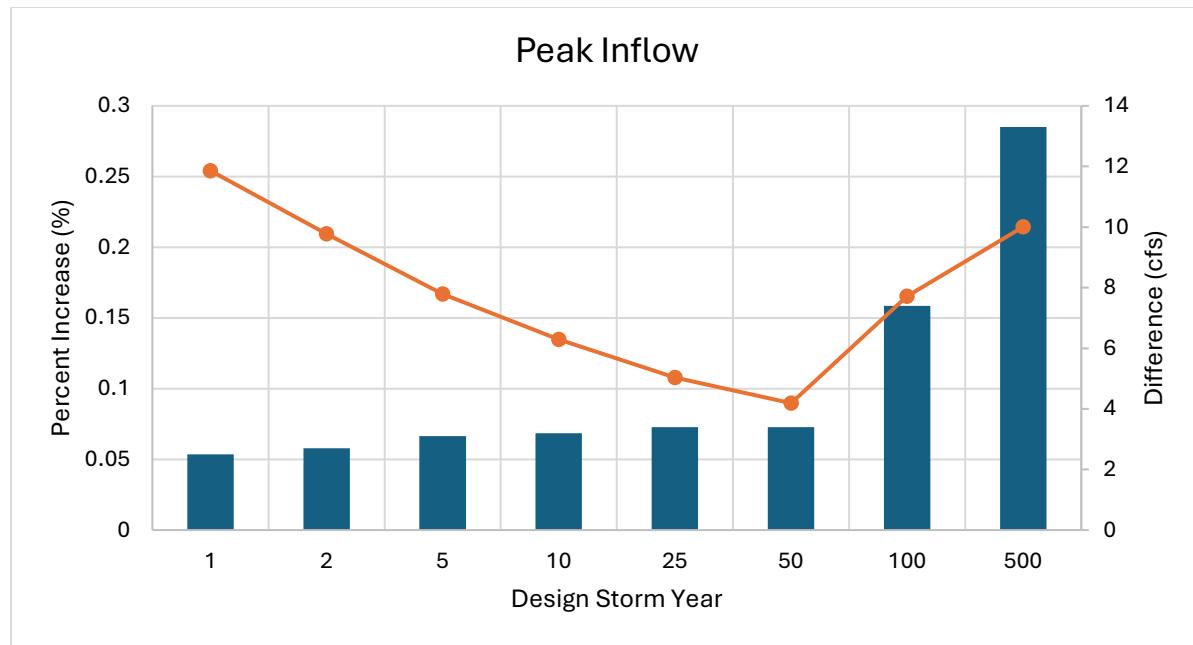

Figure 6. 6 Peak inflow change from pre-development to post-development in percent increase and cfs.

Additionally, the peak discharge from the lake does not change from pre-development to post-development, which was the most important criteria to target for. This means that the flow out of the lake and into the receiving stream is not increasing. The speed of the water is a main contributor to erosion potential. With our proposed design, we are not increasing the erosion potential and concern downstream through the water speed. Since the peak inflow increases slightly, and the peak discharge does not, the peak storage of the lake increases as well. However, this increase is not significant enough to impact the peak elevation of the lake as discussed above.

However, our design does increase the total discharge volume. The volume is given from the model in inches, which is the total depth in inches over the entire Lake area that is being discharged. These results are shown in Figure 6.7 and compared to pre-development discharge volume.

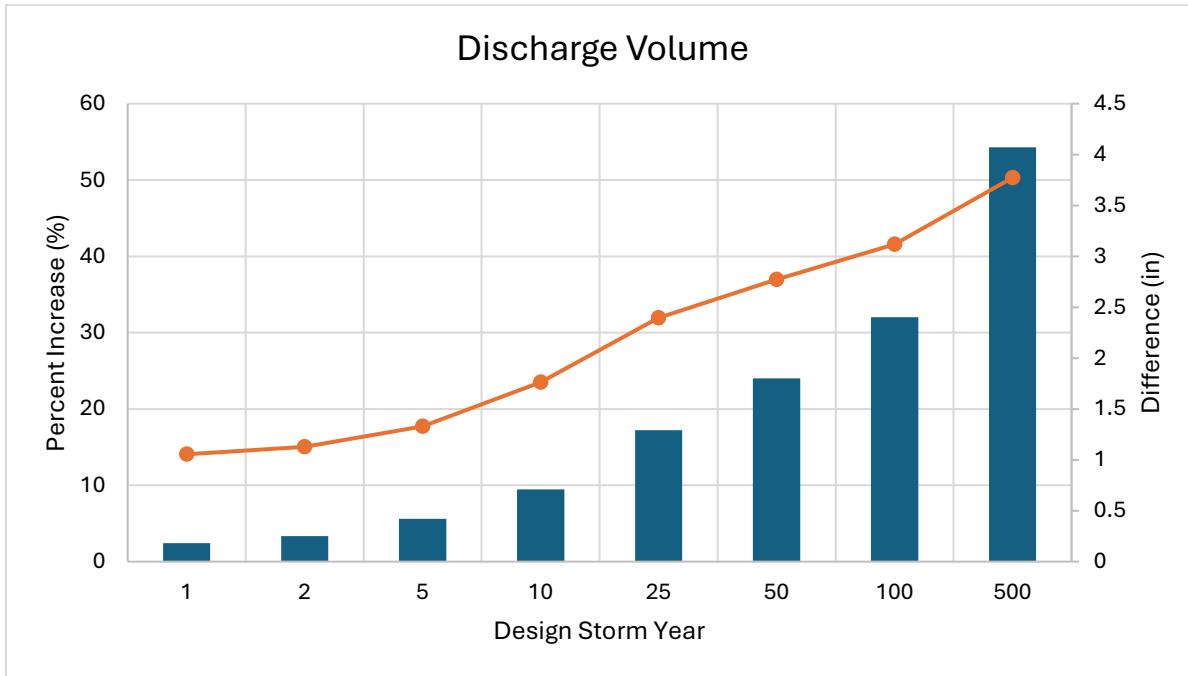

Figure 6.7 Lake discharge volume

To make sense of this graph, for example, the 1-year storm, the discharge volume was increased by 0.18 inches, which would be 0.18 inches over the entire 82-acre lake or 1.23 ac-ft of increased water volume discharging from the pre-development conditions. This is a 14.1 percent increase in discharge volume. This increase in volume without an increase in discharge flowrate means that the water is being discharged from the lake over a longer period of time in our proposed design than in the current, pre-development conditions. This could potentially have impacts on the erosion potential in the streams downstream of the lake as they would be conveying the peak flow, or a higher-than-normal flow, for a longer period of time. However, because the discharge volume for the pre-development conditions is already very low, the increased discharge volume is also a relatively small amount.

## 2. Septic Tanks

A total of five septic tanks and associated leach fields were required to accommodate wastewater generated by the newly developed cabins, restrooms, and RV dumping stations.

The first of the five septic tanks was designated for RV waste and was located near the existing RV park. This tank was designed to handle flows of approximately 2,500 gallons per day, calculated by multiplying the ten RV units by 250 gallons per day per RV in accordance with IAC 567 Chapter 69. The tank measured 13.9 feet in length and eight feet in width, with a baffle height of six feet. The inlet pipe elevation was set at six feet, with the tee extending upward to 6.5 feet and downward to 5.333 feet. The outlet pipe elevation was 5.75 feet, with the tee extending up to 6.5 feet and down to 4.75 feet. The associated leach field comprised approximately 14,700 square feet, utilizing 24 distribution pipes at 70 feet per pipe.

The second septic tank was designated to receive wastewater from the cabins. This system was sized to handle approximately 900 gallons per day, representing the estimated flow rate from six-bedroom residences. The tank measured 12.03 feet long and five feet wide, with a baffle height of four feet. The inlet pipe height was set at four feet, with the tee extending up to 4.5 feet and down to 3.33 feet. The outlet pipe height was 3.75 feet, with the tee extending up to 4.5 feet and down to 2.75 feet. The leach field for this system totaled approximately 4,800 square feet, consisting of six pipes at 100 feet per pipe.

The third septic tank received waste from the restrooms located at the south end of the lake. The estimated wastewater flow to this tank was 4,340 gallons per day, calculated based on the number of parking spaces, with each parking space assigned a design flow of 20 gallons per day. The tank dimensions were 20.18 feet in length and twelve feet in width, with a baffle height of four feet. The inlet pipe height was four feet, with the tee extending to 4.5 feet and down to 3.33 feet. The outlet pipe height was 3.75 feet, with the tee rising to 4.5 feet and extending downward to 2.75 feet. The leach field area totaled 25,500 square feet, using 29 pipes at 100 feet per pipe.

The fourth septic system was designed to treat waste generated at the existing shelter which was retrofit with a restroom. The design flow for this tank was approximately 700 gallons per day, calculated based on the available parking spaces. The tank measured 10.70 feet long and five feet wide, with a baffle height of 3.5 feet. The inlet pipe was set at a height of 3.5 feet, with the tee extending upward to four feet and downward to 2.83 feet. The outlet pipe height was 3.25 feet, with the tee extending up to four feet and down to 2.25 feet. The corresponding leach field area was approximately 3,900 square feet, consisting of five pipes at 100 feet per pipe.

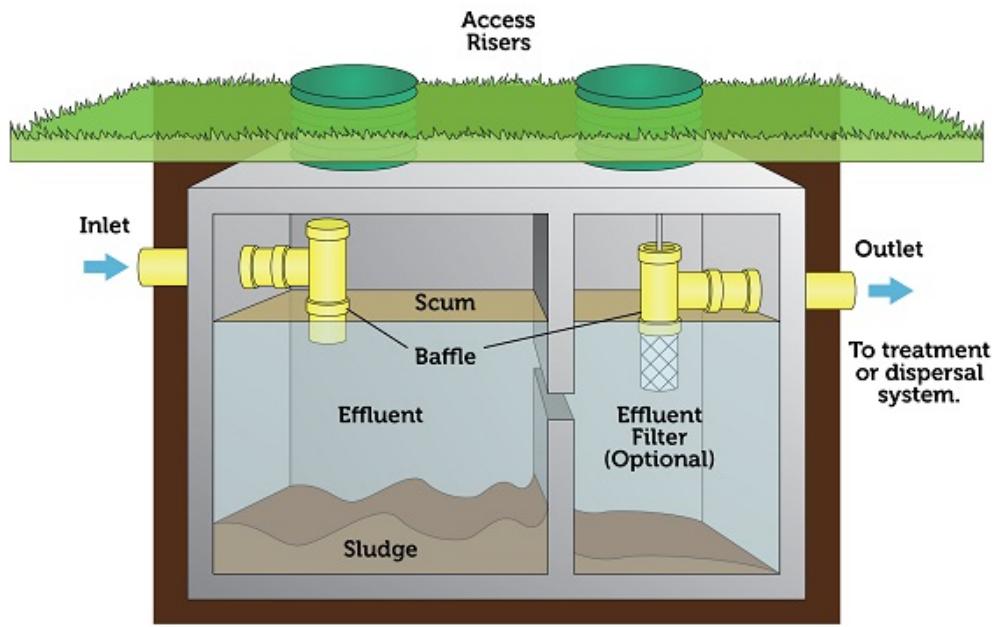

The final septic tank was designated for the new restrooms containing showers and laundry facilities. The estimated daily flow to this tank was 2,620 gallons per day, calculated based on the

number of laundry machines and total parking spaces in accordance with IAC 567 Chapter 69 and guidance from Maricopa County. The tank measured 14.59 feet long and eight feet wide, with a baffle height of six feet. The inlet pipe elevation was six feet, with the tee extending to 6.5 feet and down to 5.333 feet. The outlet pipe height was 5.75 feet, with the tee rising to 6.5 feet and extending to 4.75 feet. The leach field area totaled 15,600 square feet, incorporating 18 pipes at 100 feet per pipe. An engineering drawing detailing the dimensions of each septic tank has been provided in Figure 6.10.

The EPA provided a reference figure for a traditional septic tank, and an additional diagram of a conventional septic system was included for context. The total volume of each tank was designed at twice the expected daily sewage flow to ensure a minimum solids-settling time of two days. The primary settling compartment length, where influent first entered, was set to 0.65 times the total tank length, and each tank length was designed to be at least 1.5 times the tank width in accordance with IAC 567 Chapter 69. 18-inch manholes were designed to allow access to the tanks for maintenance purposes. The total length of distribution piping required for each leach field was determined using percolation rates for a silty loam soil with moderate structure. According to the Web Soil Survey, this soil type was the predominant classification at Lake Fisher. All leach field pipes were installed within three-foot-deep trenches spaced six feet apart. Each distribution pipe was specified as 4-inch diameter PVC installed at a slope of 1 percent.

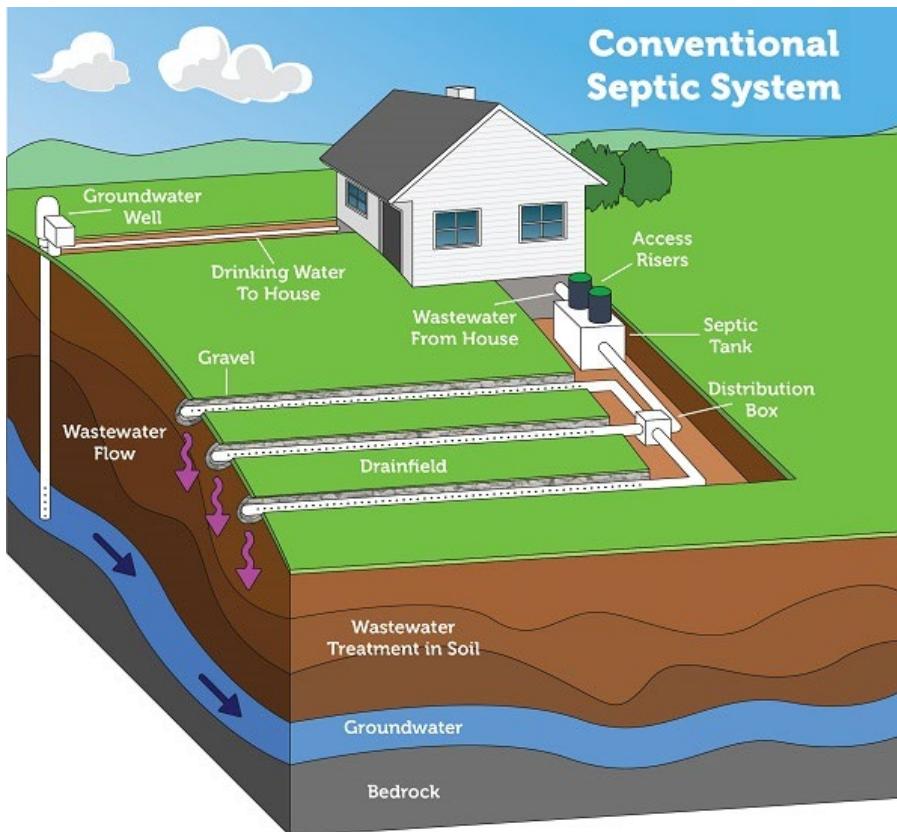

IAC 567 Chapter 69 guidance was followed to ensure the septic tank construction materials were suitable to prevent environmental contamination. The tanks installed at the Lake Fisher Recreation Area are to be constructed of a vibrated and reinforced special concrete mix with a wall thickness of 2.5 inches, a water-to-cement ratio of 0.45, a density of 650 pounds per cubic yard, and a minimum 28-day compressive strength of 4,000 psi. The tank bottom is to be constructed at a thickness of three inches, and the tank top is to be four inches thick and reinforced with 3/8-inch steel rods arranged on a six-inch grid. Reinforcing bars will be provided with a minimum concrete cover of one inch. All inlet and outlet ports were designed using heavy-duty Schedule 40 PVC. These can be purchased from vendors including PVC Pipe Supplies or Core & Main.

## Septic Tank

Please note: The number of compartments in a septic tank vary by state and region.

Figure 6. 8 Septic tank example.

Please note: Septic systems vary. Diagram is not to scale.

Figure 6. 9 Septic system example.

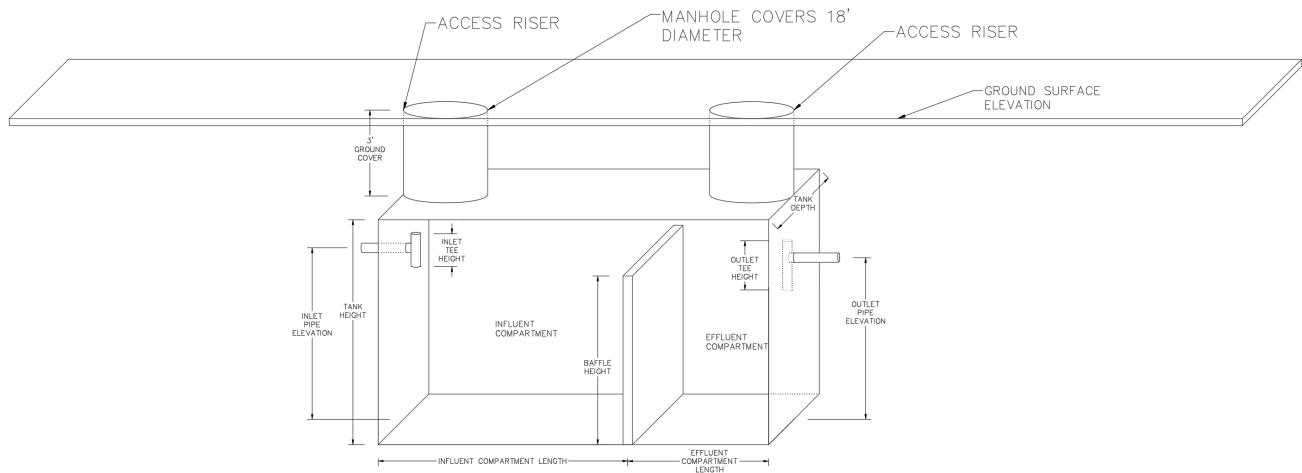

Figure 6. 10 Septic system dimensions detail.

### 3. Erosion Control

According to the Iowa DNR, erosion control has been identified as a significant concern at Lake Fisher. The erosion control practices implemented in this design were intended to address existing erosion issues while also preventing additional erosion expected to result from increased runoff following site development. At the time of assessment, the majority of erosion concerns were located along the south shoreline of the lake, detailed in Figure 6.11. To stabilize soils in these areas, the team recommended establishing a three-foot buffer of native wildflowers. This measure represented an improvement over the existing grass cover, as native wildflowers possess deeper root systems and greater capacity for long-term soil stabilization. The recommended seed mix was the Standard Forb Mix, which could be obtained from the Allendan Seed Company in Winterset, Iowa or an equivalent provider. Seeding practices were recommended to follow the procedures outlined in Section 9010 of the Iowa SUDAS Manual.

To mitigate anticipated erosion associated with increased stormwater runoff into the lake, the design also recommended the installation of riprap along the banks of the outlet stream located on the north side of the lake, detailed in Figure 6.12. Although flow increases were expected throughout the lake system, the outlet conveyed the most concentrated discharge, making it the location most susceptible to erosion and therefore the priority for protection measures.

Figure 6. 11 South Shoreline

Figure 6. 12 Outlet Stream

#### 4. ADA-Compliant Trail System

An interconnected trail system complying with the Americans with Disabilities Act (ADA) and SUDAS design standards in conjunction with AASHTO, was designed in AutoCAD Civil3D to allow for accessible travel methods to all areas of Lake Fisher Park. Specifically, a shared use path was designed to go around Lake Fisher, intended for recreational and fitness purposes. The beginning of this path is marked by a trailhead along with parking on the south side of the site. More details of the trailhead site and its design can be found below. This accessible shared use path branches off into sidewalks to increase connectivity and allow proper access to all proposed site features. Using specifications in the SUDAS Design Manual Chapter 12 – Pedestrian and Bicycle Facilities, the shared path was designated as a Type 3, as the path will primarily serve as a recreation and fitness benefit. Given the lower volume of expected users, the width of this path was set at its minimum allowable value of 10 feet to accommodate two-way traffic. While a recommended surface thickness of 5" is given by SUDAS, the design proceeded with a 6" thick pavement to serve occasional emergency vehicles in the case that a user requires assistance. For cross slopes, a 1.5%

slope is recommended, but per Section 12B-2 – Shared Use Path Design, SUDAS recommends increasing this value if the path will be unpaved, as ours is anticipated to be, to allow for draining water off the path, thus the value was increased to 2%. Following the previously mentioned SUDAS section/chapter, the shared use path was ensured to be separated by at least 6 feet at any section that runs along the existing park road. Given that the path is expected to be an unpaved surface, the design speed was set at 12 mph, giving a respective horizontal curve minimum radius of 27 feet, per Table 12B-2.01 and Table 12B-2.02 in SUDAS Chapter 12 Section 12B-2. Vertical alignments were ensured to comply with the proper stopping sight distance and minimum length requirements for each respective curve per equations 12B-2.02 and 12B-2.01. These alignments were set to follow the existing ground as much as possible to minimize cut and fill, while complying with the grade requirements in Table 12B-2.04. Finally, there are areas in which the trail is forced to cross the existing gravel road to adhere to the previously mentioned restrictions, and in these sections the path is paved 20 feet wider, per figure 12B-2.06. Design of all connecting sidewalks adhered to the same design requirements, aside from the width which was adjusted to lower values depending on the location. While design was done in a manner to allow for evaluation of all material types such as concrete, asphalt, and a compacted granular fill, the recommended material for all proposed trails is Class A compacted stone. The cost for this material is significantly lower than concrete and asphalt and is typical for nature trails. Material quantity estimations were calculated via volume tables in Civil3D. All figures related to the trail design can be found in Appendix A of this report.

## 5. Workout Areas

Three designated workout areas were placed alongside the multi-use trail to increase opportunities for visitors to exercise and socialize. Each piece of equipment and bench is to be sourced from Kompan, a reliable exercise equipment designer and manufacturer (or an equivalent manufacturer). The areas were designed at various sizes with varying pieces of workout equipment, accommodating multiple groups of people looking to exercise and socialize at the park. These are designed to support teens, adults, seniors, and wheelchair users looking to improve their health in an outdoor space. The dimensions of the areas allow for a safe and comfortable workout space, and each area is spaced out from the others to provide a variety of stopping points for users along the trail. The pieces of equipment within each workout area are spaced adequately based on Kompan's recommendations to ensure safety for the users. Wood chips are to be used as the flooring material to enhance comfortability and aesthetics. A depth of 12 inches is to be used for the wood chips to meet playground safety requirements for shock absorption. Material quantities and costs for the equipment were provided by Kompan and their partner, Crouch Recreation. The overall dimensions of these sites are noted in Figure 6.13.

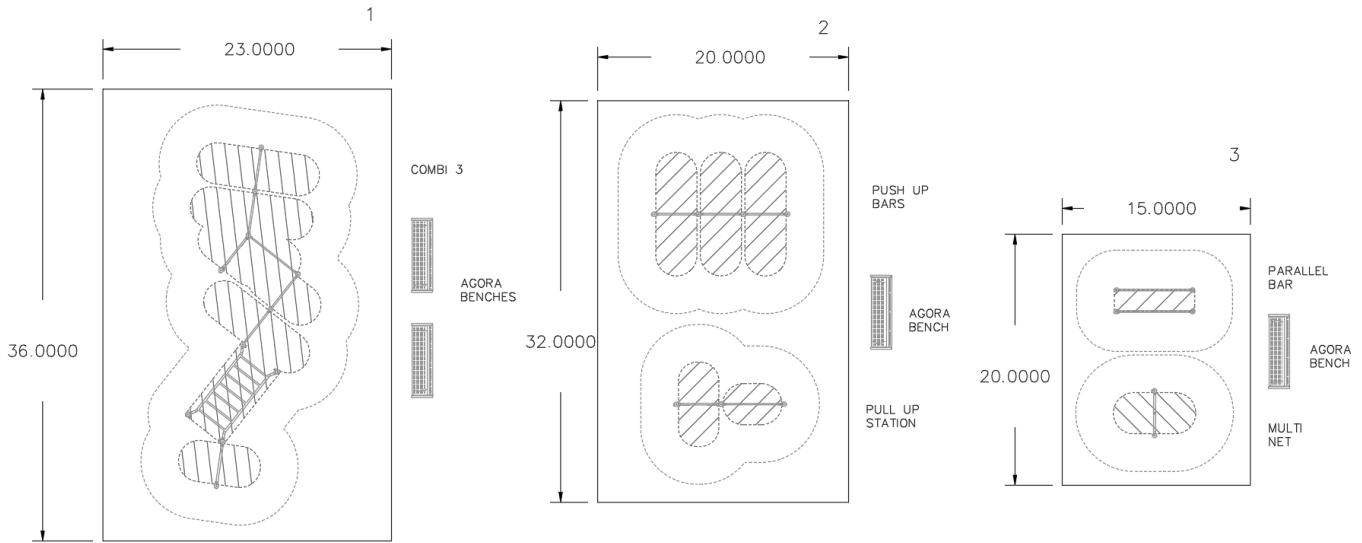

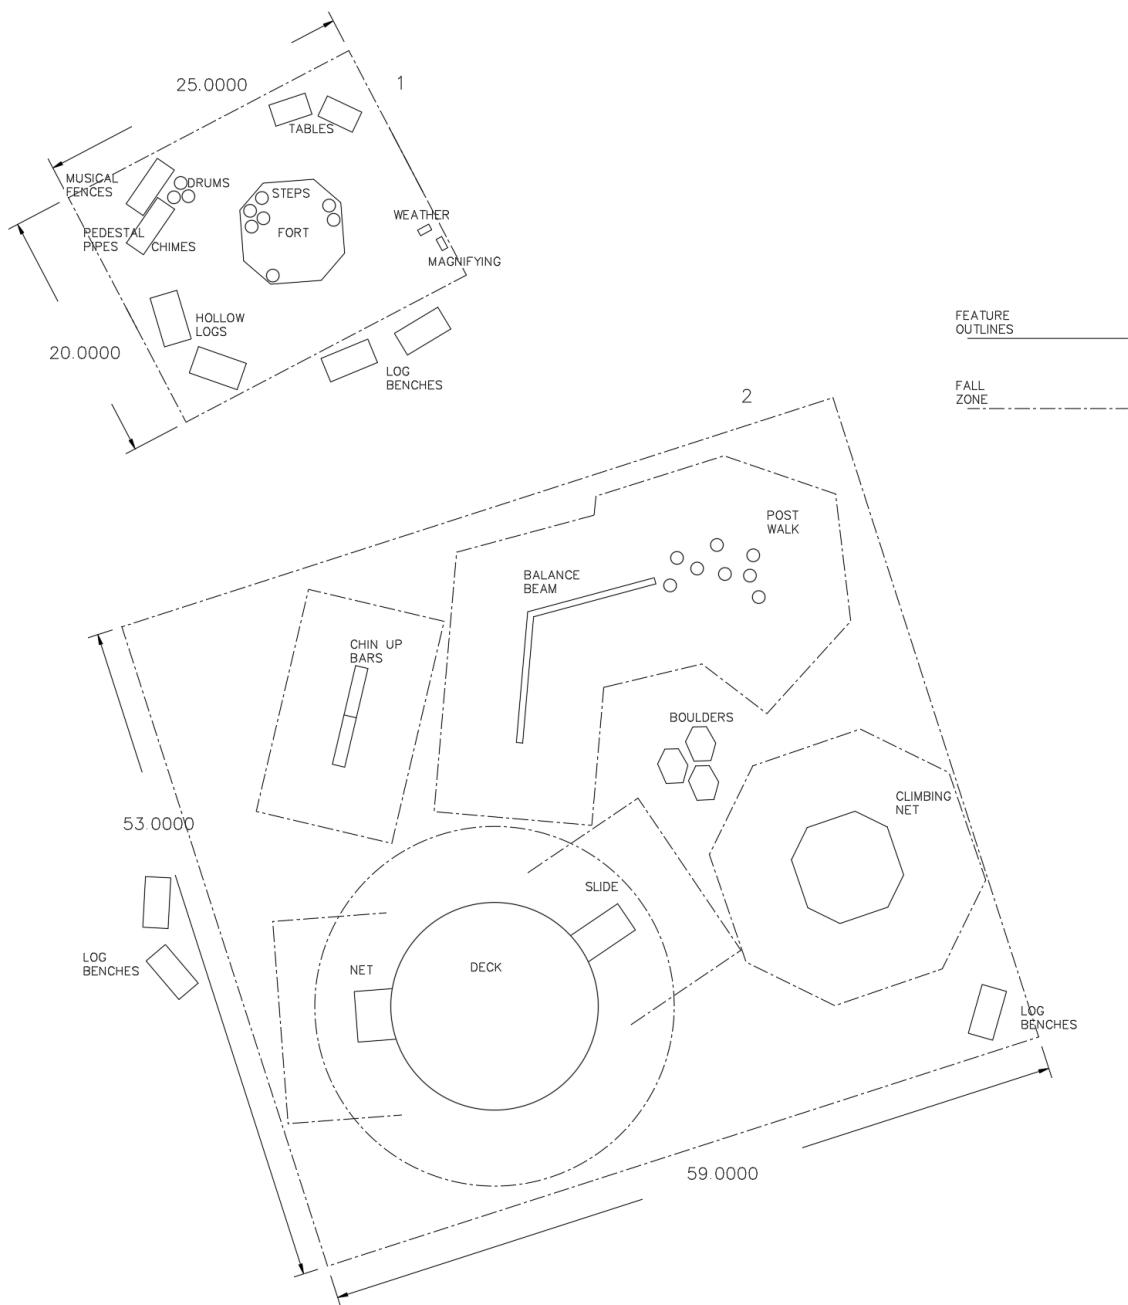

Figure 6. 13 Workout Areas Dimensions

Overall dimensions for Areas 1, 2, and 3 are designed to be 23' X 36', 20' X 32', and 15' X 20' respectively. The dimensions and materials specifications for each of the workout features and benches are provided by Kompan and can be found in Appendix H of this report. This information is also available on their website. Kompan is based in Odense, Denmark, and provide equipment for parks in 20 countries across Europe, North America, Asia/Pacific and the Middle East. Their equipment is highly customizable in terms of color and aesthetics. Crouch Recreation is a park designer and developer based in Omaha, Nebraska, and represents Kompan. Crouch Recreation is able to distribute the equipment to Bloomfield and assist the park development with help from The Henley Group as the installers. The Henley Group are based in Davenport, Iowa.

## 6. Green Playground

The plan for the green playground was developed shortly after getting in contact with Natural Playgrounds Company, a playground manufacturer and designer. Its general placement was designed to be near the shelter on the west side of the park, which allows for adequate visibility and supervision for families. The playground is separated into two areas, with Area 1 being dedicated to learning, and Area 2 being designed for physical activity. The design services provided by Natural Playgrounds Company are highly customizable in addition to their prefabricated features. The team was able to interpret the details and dimensions of each feature listed on their website to create a preliminary drawing of an adequately spaced playground. The guiding principle of this design was to

pay attention to the fall zones of each feature, which are displayed in Figure 6.14. This approach applied more to Area 2 due to it being dedicated to physical activity. A depth of 12 inches is to be used for the wood chips to meet playground safety requirements for shock absorption.

The overall dimensions of Areas 1 and 2 are 25' X 20' and 59' X 53' respectively. The dashed lines within Area 2 refer to fall zones to take note of certain features such as the deck or the balance beam. Features that have a risk of injury due to falls must have 6 feet of space for clearance, which greatly reduces the risk of additional collisions from falls.

The details regarding the materials and dimensions of each feature in the playground can be found in Appendix G. This information is provided by Natural Playgrounds Company and can be found on their website. There is a large amount of variability for each feature based on design requests, such as making features smaller or larger based on the age of users. The documents on their website are also highly beneficial for understanding the maintenance of their products. Most of their products are made of wood which means they require specific treatment and maintenance procedures year-round with the changing temperatures and weather conditions. These maintenance procedures are also detailed in Appendix G.

## 7. Rec Area

The recreational court area consists of one full-size high school basketball court and two adjacent courts designed for dual use as both tennis and pickleball courts, responding to client input that existing courts in town are frequently in use and that additional, flexible court space would better serve the community. The basketball court is sized to NFHS high school standards with an 84-foot by 50-foot playing area and a surrounding safety buffer for a total paved footprint of approximately 104 feet by 70 feet, while each dual-use court is dimensioned to standard tennis court guidelines with a 36-foot by 78-foot playing area; pickleball lines are then overlaid using a 20-foot by 44-foot playing area and recommended clearances to allow efficient shared use of the same paved surface. The overall layout, sizing, and striping can be seen in Figure 6.15 below. Additionally, the existing frisbee golf course was improved through the addition to trees as obstacles and tee boxes to better mark the location of each starting location.

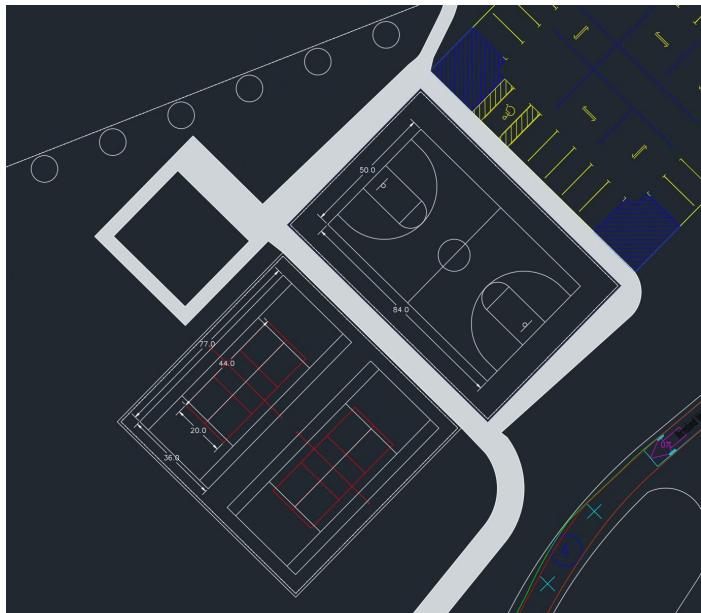

Figure 6. 15 Recreational Courts Dimensions

## 8. Beaches and Sand Volleyball

New beach areas were proposed on the south and west sides of Lake Fisher to provide designated swimming and shoreline recreation spaces. Each beach will include an adjacent sand volleyball court, and both sites are designed to tie directly into the existing trail system while accommodating high-use recreational activity. Small beach showers will be installed at each location to allow users to rinse off before returning to the parking areas.

Figure 6. 16 Beach locations

Both beaches will consist of a 1-ft-deep layer of washed recreational sand placed directly on the prepared beach surface. The beach grades will be constructed to maintain a 10% slope from the upland edge toward the water, except within the sand volleyball areas. To support consistent recreational use during fluctuating lake levels, sand will extend approximately 10–15 ft into the water at each beach, creating a fully sanded near-shore zone and a smooth transition into the lakebed.

Trails connecting to the beaches will be graded to transition from higher surrounding terrain down to the lake's lower shoreline elevation while maintaining ADA-compliant slopes. Due to steep existing contours, these connections require precise, constrained alignment, resulting in a tight grading corridor that achieves compliance without the need for stairs or retaining structures.

Each beach will include a sand volleyball court positioned outside of the 10% sloped zone to ensure proper playability. Courts will measure 60 ft by 30 ft and will utilize the same washed recreational sand as the main beach areas.

## 9. Boat Ramp

A dual-lane boat launch facility was designed on the east side of the lake to accommodate increased boating activity anticipated after park improvements, including higher-volume fishing tournaments and general recreational use. The ramp layout follows the Iowa DNR's recommended launch geometry and construction standards, modified to reflect the site's existing grades, shoreline conditions, and water-level variability. All ramp and dock components were drafted and graded in AutoCAD Civil3D to ensure accurate slab placement, elevation control, and ADA-compliant access to the floating dock system.

The launch facility will consist of two parallel concrete ramps separated by an ADA-accessible pedestrian sidewalk that provides continuous access from the parking lot to the gangway and floating dock. Ramp slabs were designed with progressively increasing grades to improve trailer submergence and launching efficiency at both design low water and bank-full conditions. The slabs start from 4% meeting at the parking lot and end at 16% finishing in the water. Reinforcement, slab thicknesses, connection types, and crushed-stone bedding depths follow standard DNR and SUDAS recommendations and are summarized in the Appendix K. All slab connections were detailed to ensure structural continuity and accommodate differential settlement along the shoreline.

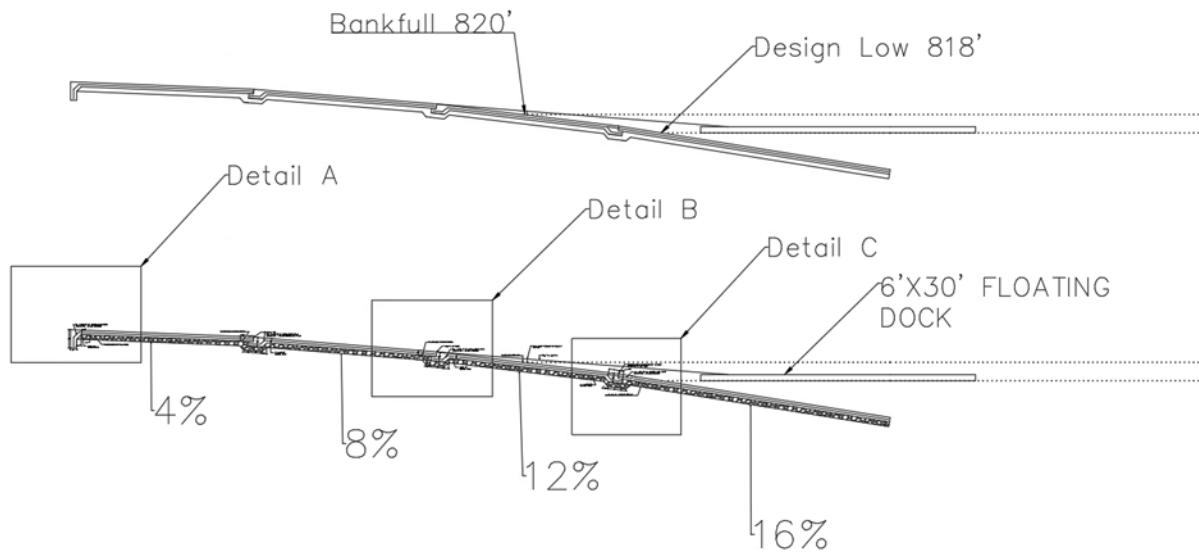

Figure 6. 17 Boat ramp section slopes and side profile with detail locations

The central sidewalk follows the ramp profile until transitioning to a cast-in-place concrete abutment, which provides the support and elevation control necessary for the gangway hinge connection. Both the sidewalk and gangway were designed to maintain slopes less than 1:12 between low-water elevation and bank-full elevation, ensuring year-round ADA compliance regardless of fluctuating lake levels. The selected gangway and floating dock modules are pre-manufactured aluminum units designed to withstand variable loading and water level changes while maintaining accessible widths in accordance with ADA and SUDAS pedestrian standards.

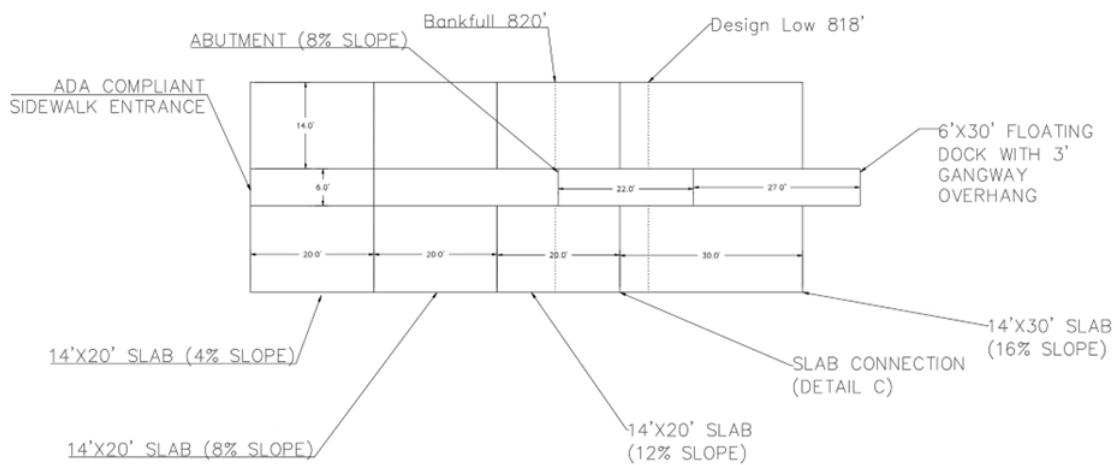

Figure 6. 18 Boat ramp plan view

To protect the shoreline and maintain long-term stability of the launch surface, Class E riprap was placed along both exterior ramp edges and in the zone between the ramps and dock abutment. The final configuration will allow two boats to launch simultaneously while maintaining safe pedestrian circulation, durable access, and compliance with all relevant DNR and SUDAS design guidance.

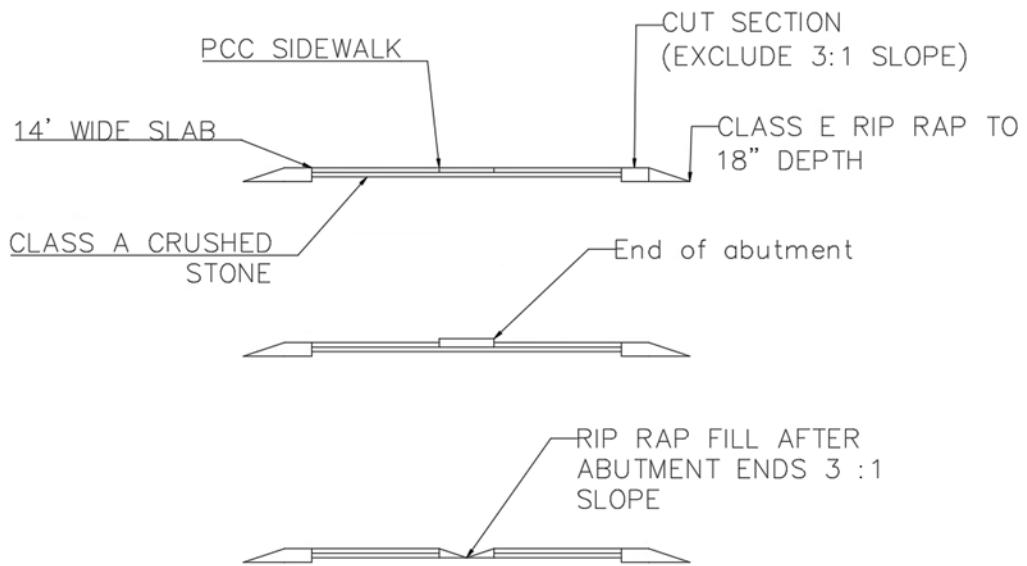

Figure 6. 19 Cross Sectional View of Boat Ramp

## 10. Docks

### Dock System

All proposed docks for Lake Fisher Park are based on designs provided by AccuDock, a manufacturer specializing in ADA-compliant recreational docking systems. AccuDock was selected for its extensive experience with accessible kayak launches, durable floating platforms, and systems engineered to remain stable throughout winter conditions. Their prefabricated ADA-compliant kayak launch, featuring integrated handrails and step-down assistance, addresses a key user need for improved accessibility and ease of entry.

The docks utilize high-density polyethylene (HDPE) floating components to provide the necessary buoyancy, freeze-thaw resistance, and flexibility to accommodate seasonal ice movement. All proprietary hardware and connection details will be installed according to manufacturer specifications. Given the custom requirements of the waterfront access discussed with the client, it is recommended to use either AccuDock custom docks or an alternative manufacturer offering equivalent performance and similar customization capabilities.

## Existing Dock Retrofit

The existing dock is currently located on the east side of the lake adjacent to the existing boat ramp. It currently features a straight dock with 3 fingers each 12' from the base of the dock. It is a floating dock design with poles being used to anchor the dock in place which need to be removed each winter. The connection to land is a 4' wide gangway with a roller on top of a concrete abutment. The retrofits will include adding a 25'x16' ADA accessible kayak launch with a 6' wide ADA compliant transition plate. This will allow kayak launching abilities without needing to construct a whole new dock. The next retrofit will include removing the poles and switching to concrete anchor attachments and utilizing 4 concrete anchors to secure the dock in place. This will allow the dock to stay in over the winter by allowing small amount of movement so the ice will not damage the dock. The only required winter maintenance will be detaching the gangway from the dock and moving it landside.

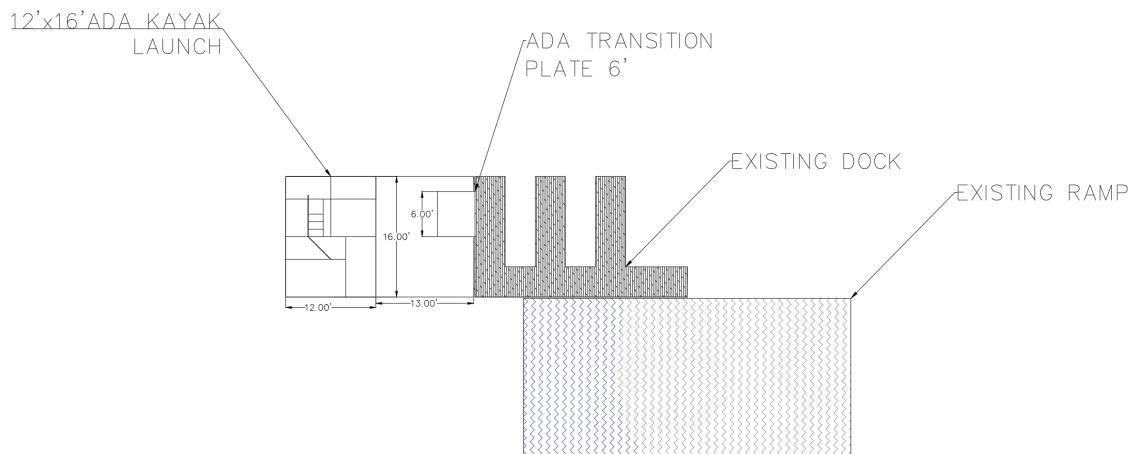

Figure 6. 20 Existing dock retrofits

## Dock 1 – Cabin/RV Area Access Dock

Dock 1 is located on the northwest fishing jetty and connects directly to the shared-use trail system, providing boating and kayak access for cabin and RV users. The dock includes a 12 ft × 18 ft ADA-compliant kayak launch, two boat slips sized for standard recreational vessels, and a 6 ft × 25 ft gangway designed to maintain ADA accessibility under both high- and low-water conditions.

The gangway connects to a 4 ft × 6 ft × 1 ft concrete abutment using a hinged joint as illustrated in Appendix K. Dock 1 utilizes Accudock's HDPE floating modules combined with concrete anchoring to allow movement under ice pressure, enabling the structure to remain in place year-round. All required dock-to-gangway and gangway-to-abutment hardware will follow the manufacturer's engineered connection system.

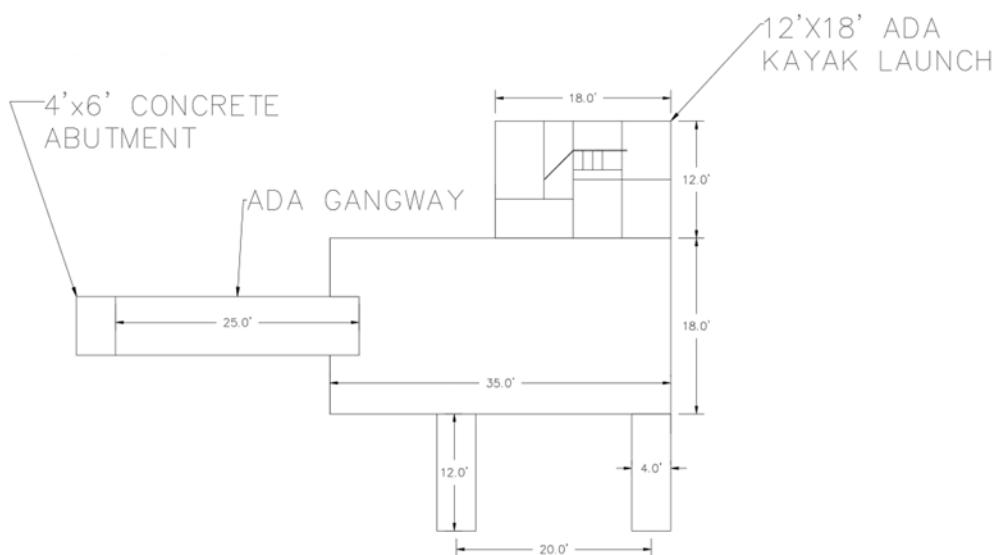

Figure 6. 21 Dock 1 Drawing

## Dock 2 – West Dock

Dock 2 is located on the west side of the lake near the primary parking area and serves as a small kayak launch and recreational swimming dock adjacent to the beach. It connects to the trail system via a 4 ft x 6 ft concrete abutment with a hinged connection. An 18 ft ADA-compliant gangway accommodates seasonal water-level changes while maintaining accessible slopes.

This dock is a floating HDPE system designed to remain in the water during winter months. It features an Accudock kayak launch integrated into a “strong-arm” structural layout, enabling secure support without the use of traditional anchors.

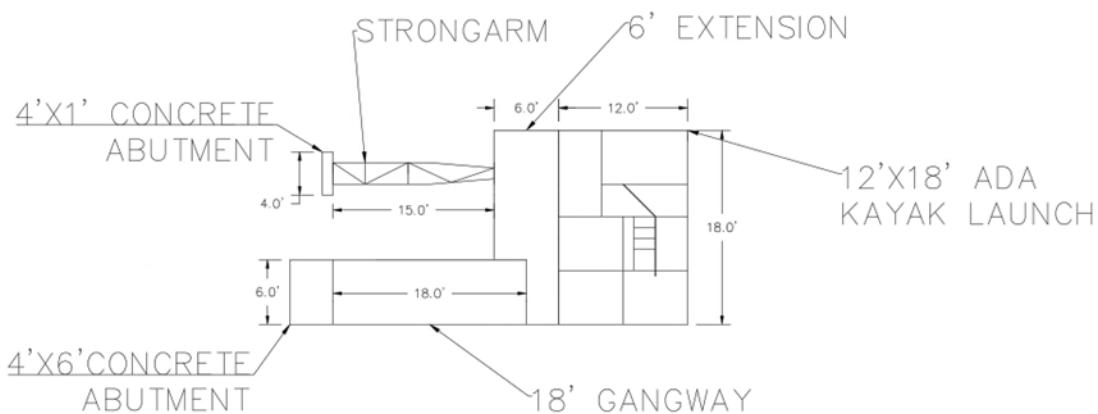

Figure 6. 22 West dock drawing

## Dock 3 – Venue Dock

Dock 3 was designed as the largest of the three dock systems and was intended to provide functional access and gathering space for the venue area. It contains two 16-ft-wide boat slips to accommodate multiple guest vessels, along with a standard Accudock ADA-compliant kayak launch. The right wing of the dock was designed as a trail-connected overlook area to support photography, seating, and small gatherings related to events.

This dock will utilize HDPE floating modules and will be secured with concrete anchoring to allow flexibility under ice loading. It will be connected to the upland trail system using two 32-ft gangways, each tied to separate 4 ft x 6 ft concrete abutments. All components, including railings and potential benches on the right wing, maintain ADA compliance throughout expected water-level fluctuations.

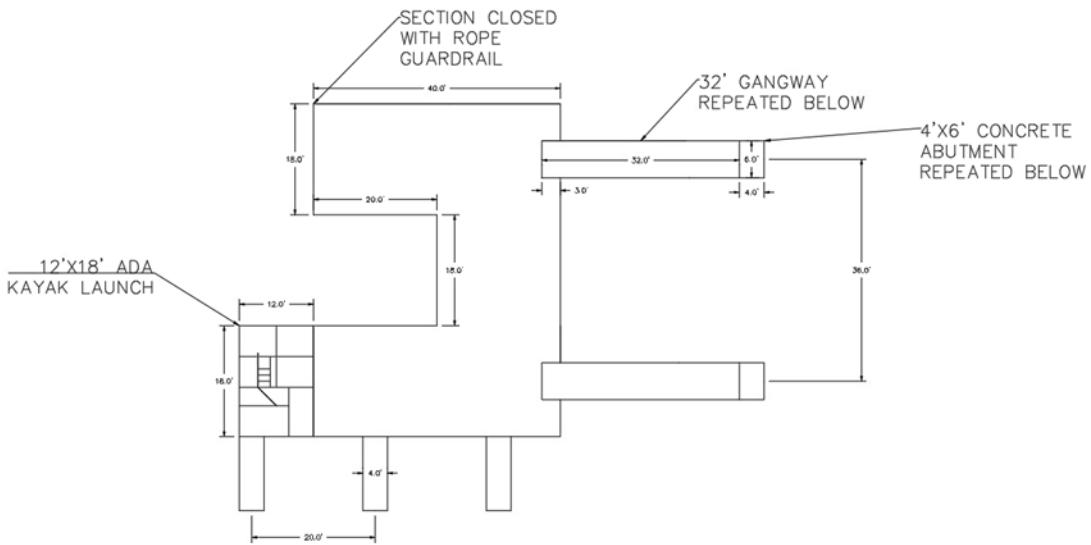

Figure 6. 23 Venue dock drawing

## 11. Dog Park

The dog park on the northwest corner of the park area was split into a large dog area, and a small dog area. This was done for both safety purposes and to increase draw and availability to the people of Bloomfield and beyond. The design for the dog park is shown below in Figure 6.24.

Figure 6. 24 Dog park location and sectioning

The large dog section was designed to have an area of 1 acre as suggested by AARP Livable Communities. This was done to prevent overcrowding while also allowing visitors to safely control their dogs. Several dog agility obstacles were included such as a jump over, jump hoop, weave poles, and paws table. Benches and a water fountain were provided to allow access to water and comfort to both the owners and the dogs in both the large and small dog enclosure. The small dog zone was designed to have an area of 0.2 acres. To enter the dog park, there will be a double fence entrance to prevent the dogs inside of the park from being let out while a new dog is entering. Trees are proposed to be planted surrounding the dog park on the north and south side in order to provide shade and separate the park from the road. A new parking lot was also designed by the dog park to provide quick access. Finally, a waste removal supply stand was provided and includes a container for waste disposal bags, and a small trash can.

## 12. Parking Lots

### Trailhead Parking

The trailhead parking lot on the south peninsula of Lake Fisher was designed to serve the venue, the beach, and visitors using the trail system. The number of parking spaces was selected based on the anticipated demand for these combined uses. The venue's estimated seating capacity is 200 people. According to Iowa SUDAS Section 8C-1.01, the closest applicable classification for determining minimum parking requirements is a church or theater, which requires 0.4 parking spaces per seat. This results in a minimum of 80 required spaces.

However, because the lot must also accommodate beachgoers and trail users, the team determined that providing parking closer to the venue's full seating capacity would be more appropriate. Using the Civil 3D built-in parking tool and applying the required stall size of 9' × 17.5' per the ITE Guidelines for Parking Facility Location and Design, the lot layout was developed. Parking lots are typically designed with a width at least twice the stall length; the resulting overall lot dimensions are approximately 183 ft × 375 ft.

With these dimensions, the projected parking count ranged between 201 and 300 spaces. Based on Iowa SUDAS Section 8C-1.02, this range required 7 ADA-accessible parking stalls. The final design provides 217 total spaces, including 7 ADA-accessible stalls. Spaces are arranged along the perimeter and in two double-sided interior rows. A swept-path analysis confirmed that a garbage truck can safely maneuver through the lot without encroaching on any parking stalls.

For every parking lot the surface will be 6" granular surfacing, class A compacted gravel. To indicate each individual stall there will be concrete stoppers and for ADA accessible stalls there will be ADA signs.

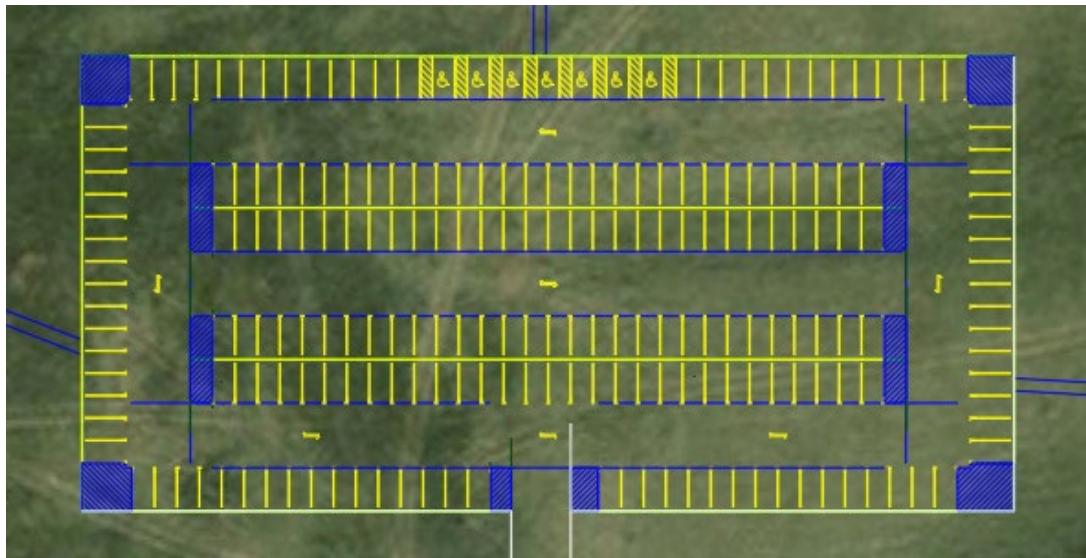

Figure 6. 25 South peninsula parking lot

Similar to the trailhead parking lot, the design of the remaining parking areas follows the same overall logic. All standard parking stalls measure 9 ft x 17.5 ft and meet the ITE *Guidelines for Parking Facility Location and Design*. These additional parking areas serve the recreational zone, the existing pavilion, and the new East Boat Ramp.

## Recreation Area Parking

The recreational area parking lot was designed to support the basketball court, two tennis/pickleball courts, and the restroom facility. No minimum number of required stalls exists for this type of amenity grouping, as such an estimated 21 stalls—including one ADA-accessible stall per Iowa SUDAS 8C-1.02—were provided. This estimate was based on anticipated usage: approximately 10 users for the basketball court, 4 users for the tennis/pickleball courts, and an additional 7 users for restroom and trail access.

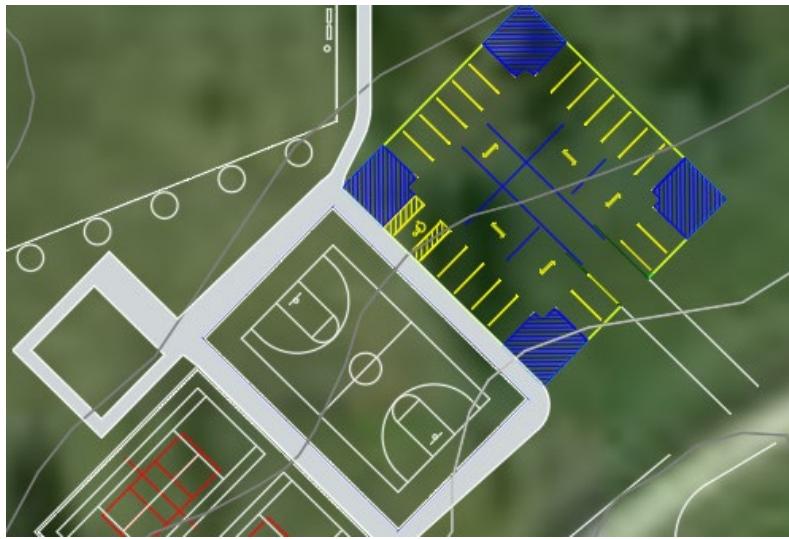

Figure 6. 26 Recreation area parking

### Existing Pavillion Parking

The parking lot serving the existing pavilion and softball field was designed similarly to the current lot but expanded to accommodate increased attendance. Although the original layout only included stalls on the west side, the new configuration adds parking on the north and south sides. The final layout includes 25 stalls, with one ADA-accessible stall provided per Iowa SUDAS 8C-1.02. An additional area including hitching post was designed to serve the Amish community.

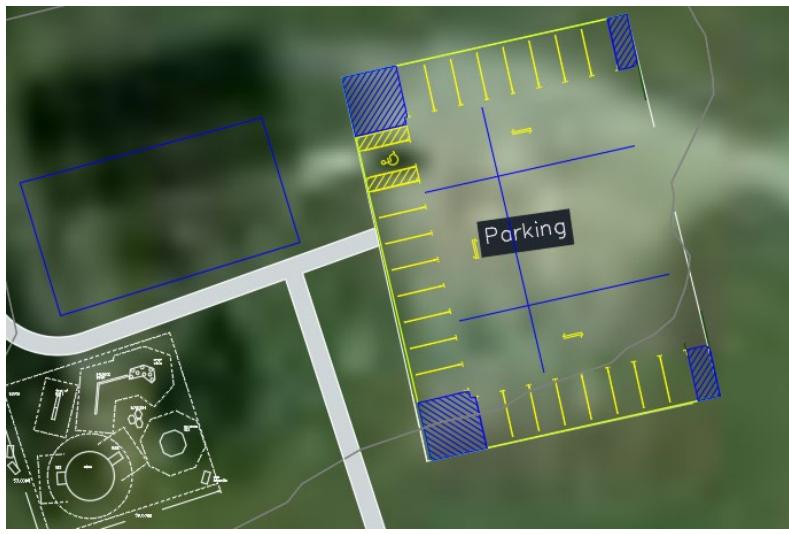

Figure 6. 27 Existing pavilion parking

## East Boat Ramp Parking

The East Boat Ramp parking lot required a different design approach to account for the larger vehicles and trailers typically used by boaters. On the north side, six standard 9 ft x 18 ft stalls are provided, while the south side includes 9 ft x 40 ft stalls suitable for vehicles pulling trailers. The layout also incorporates a 40-ft maneuvering aisle to allow large trailers adequate space to turn and back into place.

Figure 6. 28 East Boat Ramp Parking

## 13. RV Lot

The primary objective for the RV lot was to expand the available capacity while improving site accessibility and circulation. To achieve this, a 30-ft two-way through lane was introduced along the north-south axis of the existing site. Five RV stalls were positioned on each side of this central lane. The east-side stalls were set at a 45° angle oriented to the northeast, while the west-side stalls were set at a 45° angle oriented to the southwest. This angled configuration maximizes the number of stalls within the constrained site area and provides improved maneuverability for large RVs.

Each stall measures 80 ft in length and 18 ft in width, providing ample space for modern recreational vehicles and trailers. All stalls include electrical and water hookups, benches, as well as dedicated campfire areas for evening use. To save on costs, instead of a sewer system a RV dump station will be placed to the northwest of the campground providing easy access from every 57

stall. There will also be a restroom near the site with showers for the campers. Stalls are spaced approximately 50 ft apart to ensure adequate separation and user privacy.

The east-side stalls were designed to connect directly to an exit lane to facilitate efficient outbound movement. On the west side, the existing access road was realigned to allow each stall to connect through to the roadway, improving circulation and reducing the need for backing maneuvers.

The material of the surface was selected as 6" granular surfacing, class A compacted gravel. See below for the layout and swept-path analysis.

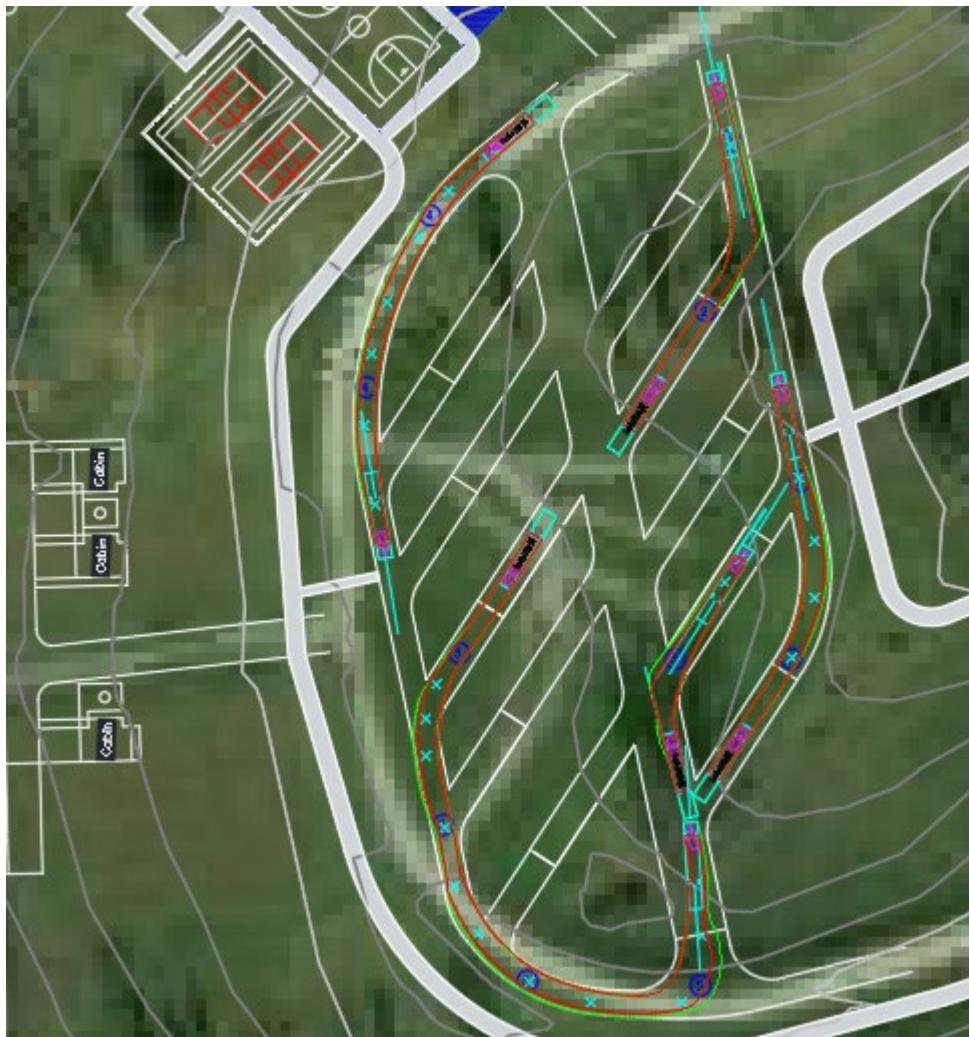

Figure 6. 29 Swept Path Analysis of Layout

## 14. Cabins

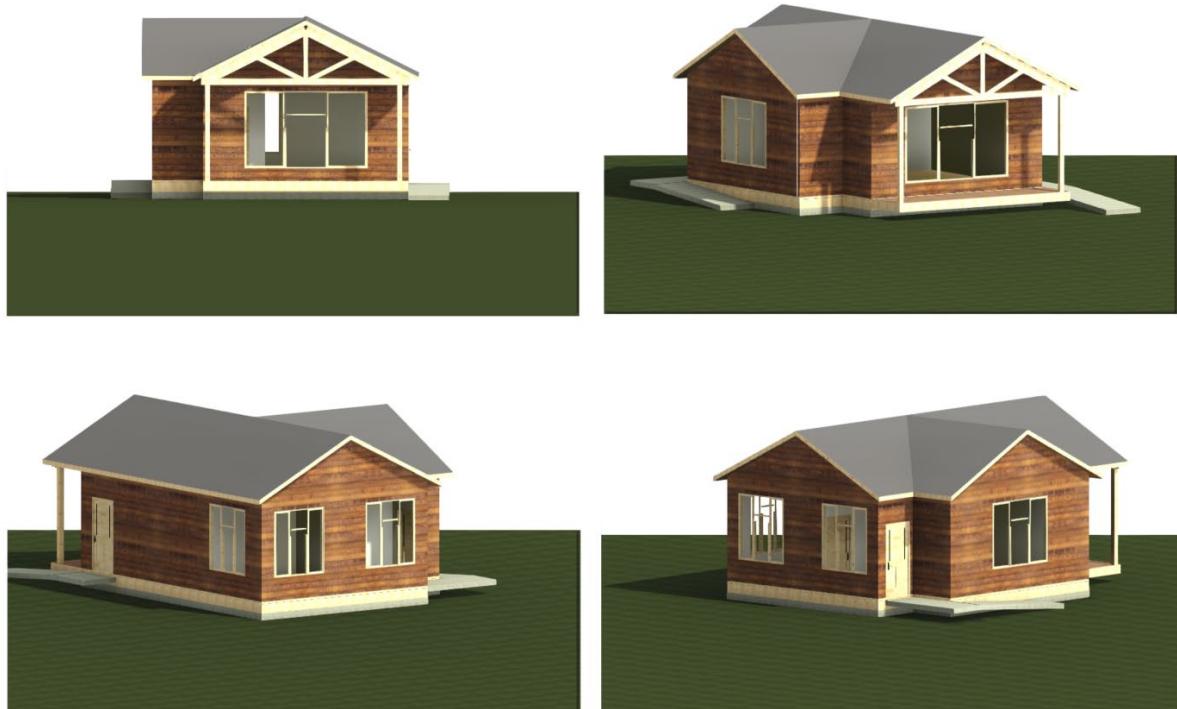

Figure 6. 30 Cabin Renders

When designing the cabin structures, the client indicated a preference for a natural wood appearance that blended seamlessly with the surrounding landscape. This aesthetic preference guided the overall design concept and informed the selection of materials, finishes, and structural components. The cabins will be intended for year-round use, with one of their primary functions being to provide comfortable and durable accommodation for hunters and traveling families during the winter season. To meet this goal, the design focused on creating energy-efficient spaces capable of withstanding cold temperatures while preserving an inviting interior atmosphere.

The project consisted of a total of six identical cabins organized on a site that would allow for incremental additions to the site depending on observed demand. Structural design considerations followed the National Design Specification (NDS) for Wood Construction published by the American Wood Council, ensuring compliance with industry standards and best practices. All major framing components were analyzed for bending, shear, and compression under typical environmental and occupancy loading.

- **Roof System:** The roof framing utilized Southern Pine No. 1 roof trusses composed of 2x12 top chords, 2x8 bottom chords, and 2x6 webs, selected after confirming their capacity to support dead, live, snow, and wind loads. Of note for this design is the use of both rigid and fiberglass batt insulation to achieve higher than standard insulation values which can not only decrease heating costs in the winter but possibly be designed to meet standards to receive additional grant money.
- **Floor System:** Because the cabins were designed with a crawl space to protect the structure from moisture and insulate the interior, the floor joists were designed using Southern Yellow Pine No.2, 2x10 lumber. These joists provide both the strength and stiffness necessary for long-term residential use.
- **Wall Framing:** Exterior walls were framed with Southern Pine No. 2, 2x6 studs. This stud size is standard for residential construction also allows for sufficient insulation thickness to support winter occupancy.

These selections ensure that each cabin meets the structural requirements for year-round living while delivering the natural wood aesthetic desired by the client. Comprehensive calculations for these components are documented in Appendix N.

In addition to the primary framing, the cabins feature exposed timber beams at the porch and entry areas to emphasize the outdoor, rustic character. These are both functional structural elements and provide an eye-catching decorative element to the 6 structures. Structural analysis confirmed that 8x8 Southern Pine No. 2 posts and appropriately sized beams provide more than sufficient support for roof overhangs and porch loads. Full calculations for these elements are included in Appendix N.

Each cabin rests on a reinforced concrete foundation designed to ensure long-term durability. The USDA Soil Survey identified the site soil as sandy loam with an allowable bearing pressure of 2,500 psf. Based on structural analysis (Appendix I), the footings for each cabin were designed as square spread footings measuring 3 feet by 3 feet, resulting in a bearing pressure of 1,120 psf and a factor of safety of 2.2.

Overall, the cabin design successfully integrates structural integrity with the natural wood aesthetic envisioned by the client. By combining exposed timber elements, insulated framing, and a durable foundation system, the final design provides comfortable, reliable lodging suitable for hunters and other guests throughout the year.

## 15. Venue

When designing the venue, the client requested that it resemble the pavilion at Honey Creek Park. This served as the primary inspiration for the overall concept. The goal was to create a large, open space that could accommodate a variety of events while maintaining a natural and inviting aesthetic. To achieve this, the design incorporated wide-span timber trusses paired with substantial timber columns and girders, ensuring both structural integrity and visual appeal. The trusses were designed to span 45 feet, supported by robust timber elements that complement the open layout.

Structural design considerations were guided by the National Design Specification (NDS) for Wood Construction published by the American Wood Council, ensuring compliance with industry standards and best practices. Each truss component was carefully analyzed for strength and performance under expected loads:

- **Top Chords:** After completing tensile and bending checks, Southern Pine Grade 1, 2x6 dimensional lumber was selected for its strength and durability. Each truss requires approximately 48 feet of this material.
- **Bottom Chords:** Compression checks indicated that Southern Pine Select Structural, 2x8 lumber was the most suitable choice. Each truss uses 45 feet of this grade.
- **Web Members:** Evaluated for both tensile and compressive strength, the webs utilize Southern Pine Grade 2, 2x4 lumber, totaling 60 feet per truss.

These selections ensure that the trusses meet all structural requirements while maintaining the desired aesthetic. Detailed calculations for all truss members are provided in Appendix C.

Figure 6. 31 Venue trusses

In addition to the trusses, the girders and columns were designed using timber to preserve the natural aesthetic throughout the park. Oversized timbers were chosen intentionally to create a visual effect reminiscent of a forest canopy, reinforcing the connection between the venue and its

surroundings. Structural analysis confirmed that 10x10 Southern Pine Grade 2 columns provide more than sufficient support for the anticipated loads. Girders were incorporated to reduce spacing between trusses while allowing columns to remain separated, preserving the open design without compromising stability. Full column and girder calculations are included in Appendix C along with the venue calculations.

Figure 6. 32 The Venue located on the south peninsula

The flooring consists of a 6-inch concrete slab, reinforced with #5 rebar spaced at 24 inches in both directions, meeting industry standards for durability and load-bearing capacity suitable for concerts, weddings, and other large gatherings. For the foundation, each column required a square footing to distribute loads effectively and prevent settlement. Using the USDA Soil Survey, the allowable bearing pressure of the loam soil was determined to be 43.5 psi. Based on structural calculations (see Appendix C), the square footings were sized at 6 feet by 6 feet, resulting in a bearing pressure of 11.7 psi and providing a factor of safety of 3.7. This ensures that the foundation system is robust and capable of supporting the venue under all anticipated conditions. Thorough calculations for the foundation design are provided in Appendix I.

Overall, the design successfully integrates structural performance with aesthetic considerations, creating a venue that is both functional and visually appealing. The use of natural timber elements

and open spans reflects the client's vision while adhering to engineering standards for safety and reliability.

## 16. Restrooms

### Recreational Area Restroom

The primary considerations for the restroom facility near the recreational area were year-round usability and energy efficiency, while also enhancing the overall appeal of the campsite. To make the restrooms a key attraction, the design includes not only standard restrooms but also laundry facilities and spacious showers. This provides RV users with access to larger, more comfortable showers than those typically found in their vehicles, as well as the convenience of on-site laundry services, eliminating the need for trips to off-site laundromats.

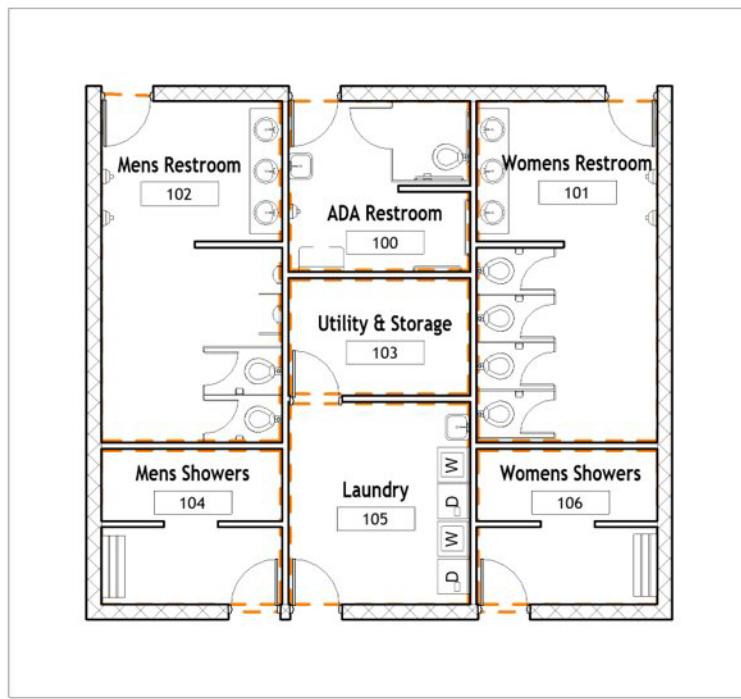

Figure 6. 33 Recreation area restroom layout

A major design priority was ensuring the restroom building operates efficiently and sustainably. The exterior walls will be constructed using 12-inch CMU (Concrete Masonry Unit) block, which offers excellent insulation properties for year-round thermal performance while also providing structural

support for the roof system. To further enhance sustainability, the roof will feature a 5-kW solar power system, ideally suited for the building's east-west orientation and 3/12 slope. Based on irradiance data for Bloomfield, the system will utilize 330-watt panels, requiring a total of sixteen panels to achieve the desired capacity. Additional battery storage can be incorporated, with options such as 300 Ah batteries available for approximately \$500 each. All lighting within the restroom will utilize LED fixtures, significantly reducing energy consumption. Other energy-efficient features include an electric heating system, electric water heater, and air hand dryers, all of which can be powered primarily by the solar system and supplemented by the municipal grid during periods of low solar irradiance.

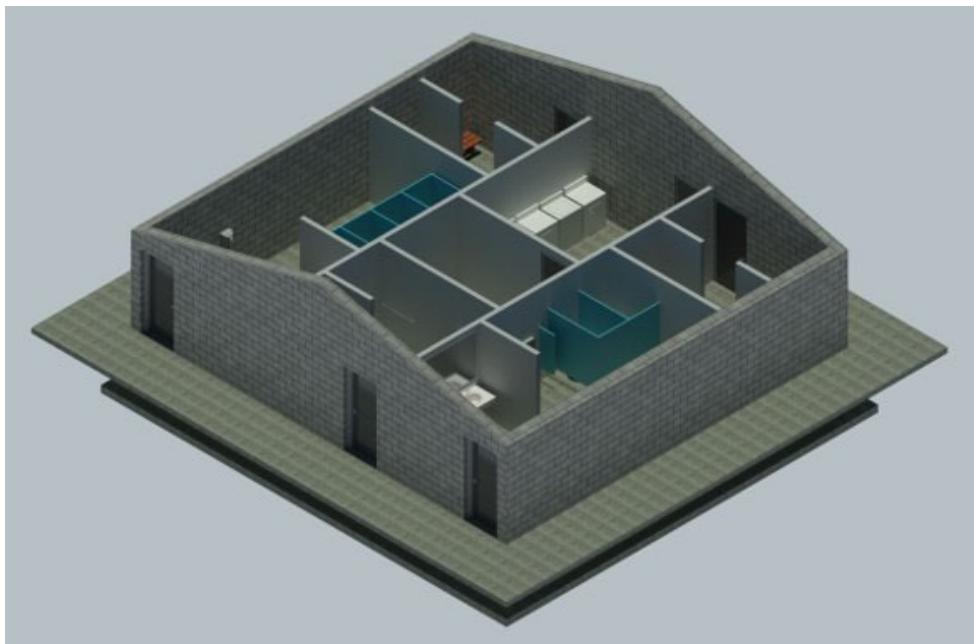

Figure 6. 34 Recreation area restroom rendering

The restroom layout was designed to accommodate a high volume of users while meeting accessibility standards. It includes two urinals and six stalls, along with one ADA-compliant stall in the family restroom. The family restroom also features an ADA-compliant shower and a baby changing station. Plumbing will be centralized within interior partition walls to prevent freezing during cold weather and to simplify maintenance. A dedicated utility room will house the HVAC system, plumbing components, solar storage batteries, and the power transformer, ensuring efficient organization and accessibility.

Structural integrity will be achieved through reinforced CMU walls and a concrete slab foundation. The 12-inch CMU block walls will be reinforced with #5 rebar every 16 inches vertically and every 24

inches horizontally. The floor slab will consist of a standard 6-inch concrete slab reinforced with #5 rebar spaced at 24 inches in both directions. A spread footing system was selected for its simplicity and effectiveness in distributing loads. The total footing area will be 560 square feet, resulting in a bearing pressure of 7.517 psi, which was well below the allowable limit and provides a factor of safety of 5.8.

*Figure 6. 35 Alternative view of rendered recreation area restroom*

This design ensures the restroom facility is not only functional and accessible but also energy-efficient and structurally sound, aligning with modern sustainability goals while enhancing the overall user experience at the RV park.

### Trailhead Restroom

The primary considerations for the restroom facility near the venue were guest comfort, accessibility, and aesthetics, while also ensuring energy efficiency and structural integrity. To enhance the overall experience for guests, the restrooms will feature large mirrors and upscale finishes, creating a functional space suitable for formal and informal events. The layout includes two urinals, four stalls, and an ADA-compliant family restroom, ensuring accessibility for all guests and compliance with modern building codes. These accommodations were designed to handle high occupancy during large events while maintaining a clean and inviting atmosphere.

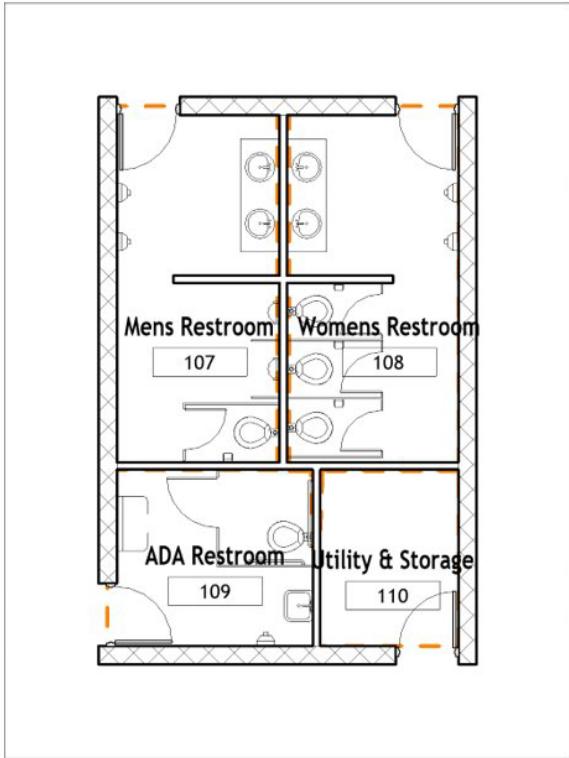

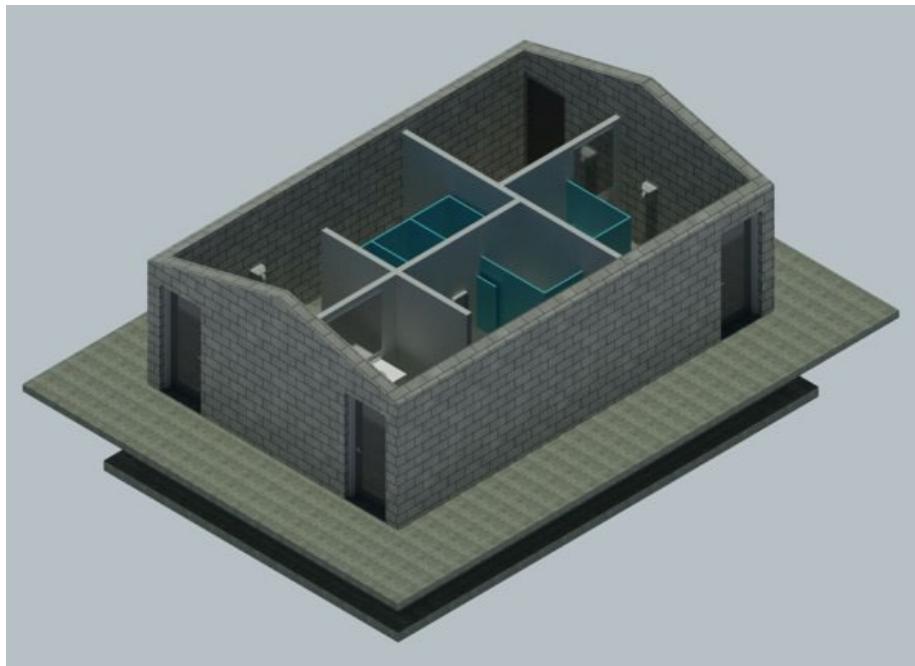

Figure 6. 36 Trailhead restroom layout

The utility room, while no longer centralized, remains fully enclosed and insulated to protect equipment from environmental exposure. It will be constructed using 12-inch CMU (Concrete Masonry Unit) block walls with insulation, providing durability and thermal efficiency for the venue's operational needs. This space houses essential systems such as HVAC components, plumbing connections, and electrical infrastructure, ensuring efficient organization and ease of maintenance.

Structural integrity will be achieved through reinforced CMU walls and a concrete slab foundation. The restroom and utility areas utilize 12-inch CMU block walls, which offer excellent insulation properties for year-round thermal performance while providing robust structural support. The floor slab will consist of a standard 6-inch concrete slab reinforced with #5 rebar spaced at 24 inches in both directions, meeting industry standards for durability and load-bearing capacity.

*Figure 6. 37 Rendering of trailhead restroom showing layout*

For the foundation, a spread footing system was selected to effectively distribute loads. Based on structural calculations, the total footing area is 395 square feet, resulting in a bearing pressure of 6.55 psi, which is well below the allowable soil bearing capacity and provides a factor of safety of 6.6.

*Figure 6. 38 Alternative view of rendered trailhead restroom*

### Existing Pavilion Restroom

The restroom facilities for the existing pavilion near the softball field were designed with simplicity, accessibility, and durability as the primary considerations. As this is an existing structure intended for seasonal use only, no foundation modifications were required, and the design focused on providing essential amenities for visitors during events.

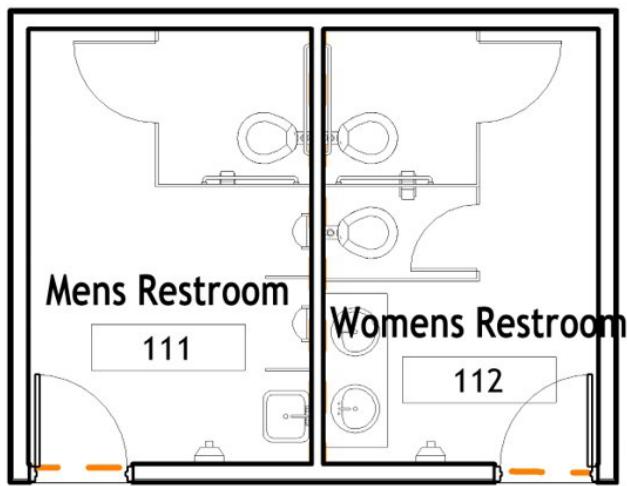

Figure 6. 39 Existing Pavilion restroom layout

The restroom layout includes two urinals, one standard stall, and two ADA-compliant stalls—one in each restroom—ensuring compliance with accessibility standards and convenience for all users. The design prioritizes functionality and ease of maintenance, with finishes selected for durability rather than decorative features.

Unlike previous designs, this restroom does not include a utility room or complex mechanical systems. The structure uses insulated stud walls with wood siding, offering a cost-effective and aesthetically pleasing solution that complements the surrounding park environment. This approach provides adequate thermal performance for seasonal use while maintaining durability against outdoor conditions.

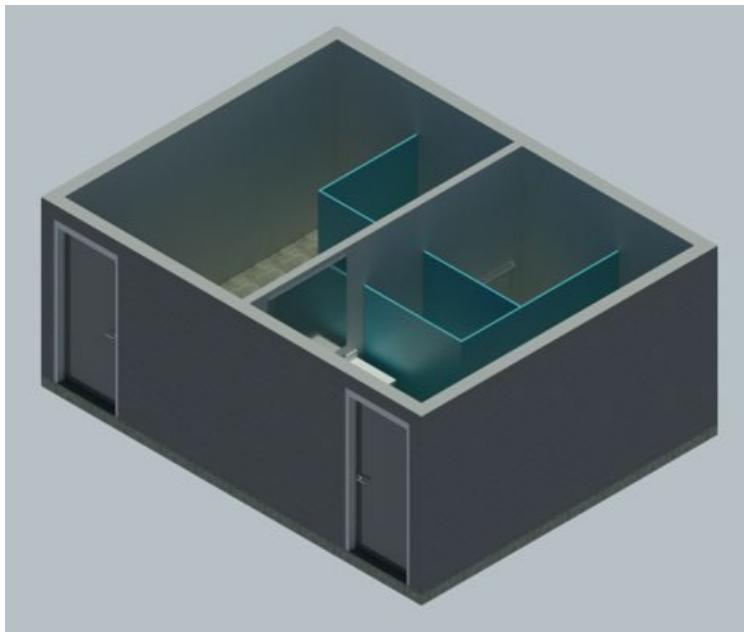

Figure 6. 40 Rendering of Existing Pavilion restroom

Lighting and ventilation systems are designed to meet standard requirements for comfort and safety during events. Plumbing is simplified to reduce maintenance needs and accommodate the limited operational period.

This restroom design provides a practical and accessible solution for the pavilion, meeting ADA requirements and offering essential amenities for visitors. By using insulated stud walls with wood siding and eliminating unnecessary complexity, the facility ensures functionality and ease of maintenance while aligning with the seasonal nature of the venue.

## 17. Fish Population Management

Historically, the overpopulation of three fish species—Common Carp, Yellow Bass, and Gizzard Shad—has contributed to persistent water quality and ecological challenges within Lake Fisher. These species, identified by both the City of Bloomfield and the Iowa Department of Natural Resources (IDNR), negatively influence lake clarity, nutrient balance, and the stability of desirable fish populations.

Common Carp are benthic feeders that disturb lakebed sediments while foraging. This activity resuspends solids and nutrients, leading to increased turbidity and elevated phosphorus levels. The resulting nutrient enrichment promotes algal blooms, which can restrict sunlight penetration, inhibit aquatic plant growth, and reduce dissolved oxygen concentrations.

Yellow Bass, a small predatory species known for rapid reproduction, prey on the young of more desirable fish species and compete directly with larger sport fish for forage. Their proliferation disrupts balanced predator-prey dynamics and hinders the establishment of a healthy, diverse fishery.

Gizzard Shad further compound water quality issues by consuming zooplankton—the primary food source for juvenile game fish—and by feeding on bottom detritus. This behavior resuspends phosphorus-rich organic material, exacerbating the potential for algal blooms. Collectively, these impacts can reduce water quality to levels that increase the likelihood of periodic fish kills.

Following consultation with the IDNR, the agency indicated that the only effective method for fully removing these overpopulated species is the application of rotenone. Rotenone is a plant-derived piscicide that interrupts the oxygen uptake mechanism in fish gills. The IDNR advised that, to allow Lake Fisher to achieve long-term ecological restoration, a whole-lake treatment using a sufficiently high concentration of rotenone would be necessary to eliminate the existing fish community.

Such an intervention would be conducted under the IDNR's ongoing Lake Restoration Program. During discussions with the IDNR, several considerations and constraints were identified. First, rotenone requires time to naturally break down within the water column, during which recreational use may be limited. Second, strict measures must be implemented to prevent rotenone discharge through the primary outlet structure to avoid impacts on downstream waterways. Third, a detailed fish restocking plan must be established to ensure the timely reintroduction of desirable sport and forage species following treatment.

## 18. Water Quality

A comprehensive water quality investigation was conducted to identify any constituents of concern within Lake Fisher. Five samples were collected from key hydrologic locations, including the southwest inlet, southeast inlet, the area north of the berm on the southeast shoreline, the west side of the lake, and the outlet at the north end. A map showing the sampling locations is provided in Appendix E.

These samples were analyzed in collaboration with the Center for Health Effects of Environmental Contamination at the University of Iowa and evaluated for general water quality parameters, major ions, PFAS compounds, metals, pesticides, herbicides, insecticides, and fungicides. The results indicated no major water quality concerns for the lake as a whole. However, the southeast inlet exhibited the poorest water quality among the sampling locations, which was expected given that its sub watershed drains both agricultural land and a large urban area compared to other sub watersheds draining to the lake. This inlet demonstrated the highest concentrations of E. coli,

nitrate, ammonia, turbidity, PFAS, several metals, and the insecticide imidacloprid. All water quality data collected can be found in Appendix E.

To improve overall water quality within Lake Fisher, a multi-faceted strategy is recommended. The first component involves the removal of overpopulated fish species that negatively affect lake clarity and nutrient dynamics, consistent with IDNR restoration guidance. The second focuses on enhancing natural treatment processes through the construction of wetlands at both major inlets, which will help remove contaminants, reduce sediment loading, and improve ecological function. The third recommendation emphasizes community engagement within the upstream watershed to communicate water quality goals and promote practices that reduce pollutant runoff into the lake.

## 19. Wetlands

The planting of wetland areas is recommended at both the southeast and southwest inlets of Lake Fisher. The primary design objectives include enhancing wildlife habitat, improving opportunities for hunting and fishing, and increasing the visual quality of the inlet areas. In addition to these ecological and recreational benefits, the selected vegetation will support pollutant removal through biological uptake and by providing surface area for microbial communities that facilitate biodegradation.

Sediment capture ponds were originally constructed at these inlet locations in the 1990s. For the current design, the procedures outlined in Section 9.08 and Chapter 3 Section 6 of the Iowa Stormwater Management Manual (ISWMM) were applied to confirm that the existing sediment forebays and ponds provide adequate storage for the required Water Quality Volume (WQv) and Channel Protection Volume (CPv). Supporting calculations are provided in Appendix F.

To improve water quality treatment prior to discharge into Lake Fisher, it is recommended that the sediment capture ponds be vegetated with plant species known for effective nutrient, metal, and pollutant removal. A table including common Iowa wetland species utilized for the removal of nutrients, sediment, and metals is included in Appendix F.

Due to the nature of this wetland system, and the fact that pollutant removal is a secondary objective the anticipated removal of pollutants is significantly lower than had a complete constructed wetland been designed. Table 6.1 below shows a conservative estimate of pollutant removal based on the constructed wetland removal percentages provided in ISWMM chapter 4. Tables 6.2 and 6.3 below indicate the anticipated concentrations of contaminants before and after wetlands are implemented.

Table 6. 2: Conservative removal Percentages Based on ISWMM Ch. 4

| Design removal percentages |      |      |               |  |  |  |            |  |  |  |

## Section VII Engineer's Cost Estimate

The cost estimate for the Lake Fisher project was developed primarily using data from the Iowa Public Works Service Bureau, Iowa DOT bid tabs, and quotes obtained directly from manufacturers. Given the overall scale and complexity of the project, as well as the fact that the design is currently at the 60% stage, a contingency of 40% was applied to account for potential unknowns and items not yet fully defined. The estimated cost for each project phase is summarized below, with detailed itemized cost tables for each design feature within each phase provided in Appendix O.

*Table 7. 1: Estimated cost for each phase and total project cost*

| Phase | Cost            |
|-------|-----------------|
| 1     | \$ 2,114,721.00 |
| 2     | \$ 2,754,731.00 |
| 3     | \$ 1,989,246.00 |
| 4     | \$ 1,305,962.00 |
| Total | \$ 8,164,660.00 |

## Appendix A-Trails

### Trail Design Specifications

**Table 12B-2.01:** Shared Use Path Design Speed by Context

| <b>Design Speed</b> | <b>Shared Use Path Context</b>                     | <b>Description</b>   |
|---------------------|--|--|
| 12 mph              | Unpaved path surfaces                              | On unpaved path surfaces, bicyclists tend to travel slower to compensate for reduced braking ability, so a lower design speed (12 mph) may be used.  |
| 15 mph              | Paved, high volumes with diverse users             | For most shared use paths with higher volumes of users in relatively flat areas, a design speed of 15 mph is generally appropriate due to the mixed-use operation with pedestrians on the facility.  |
| 18 to 30 mph        | Paved, low volume of users, especially pedestrians | For shared use paths with lower volumes of users, where pedestrian volumes are low (less than 30%), where the primary purpose of the shared use path is to provide a higher speed bicycling opportunity between destinations, or on wider paths where bicycles are provided separate spaces from pedestrians, a design speed of 18 to 30 mph may be appropriate. |
| 18 to 30 mph        | Paved, rolling terrain                             | On shared use paths with rolling terrain and sustained steeper grades (greater than 5%), the appropriate design speed should be selected based on the anticipated travel speeds of bicyclists going downhill; however, design speed should generally not exceed 30 mph.  |

## Dead Loads

|             |   |   |
|-------------|---|---|
| Roof Loads  |   |   |
|             | $TW := 4.5 \text{ ft}$                            |   |
| Dead Loads  |   |   |
| Sheet Metal | $SM := 2.5 \text{ psf}$                           | Boise 20 Gauge  |
| Roofing     | $RF := 7 \text{ psf}$                             | Boise Joists 2x8 16" o.c.,<br>R-49 insulation, 1/2" gypsum<br>board (Decorative planks) |
| Solar       | $SP := 2.3 \text{ psf}$                           |   |
|             | $w_d := ((SM + RF) \cdot TW) = 0.043 \text{ klf}$ |   |

## Live Loads

### Snow Loads

$$p_g := 38 \text{ psf}$$

$$W_2 := 0.55$$

$$C_e := 1 \quad \text{Table 7.3-1} \quad \text{Partially Exposed and Surface Roughness C}$$

$$C_t := 1.2 \quad \text{Table 7.3-2 \& 7.3-3}$$

$$p_f := 0.7 \cdot C_e \cdot C_t \cdot p_g = 31.92 \text{ psf}$$

$$R := 49$$

$$w_{s1} := p_f \cdot TW = 0.144 \text{ klf}$$

### Sloped Roof

$$C_s := 1 \quad \text{Table 7.4-1c} \quad 4"/12" \text{ Roof Slope}$$

$$p_s := C_s \cdot p_f = 31.92 \text{ psf} \quad p_g := 38 \quad l_u \quad \text{Length of roof upwind}$$

$$0.3 \cdot p_s = 9.576 \text{ psf} \quad \gamma := 0.13 \cdot p_g + 14 = 18.94 \quad S := 3$$

$$w_{s2} := 9.576 \text{ psf} \cdot TW = 0.043 \text{ klf}$$

### Balanced Snow Load

East to West

$$l_{u1} := 26$$

$$h_{d1} := 1.5 \cdot \sqrt{\frac{p_g^{0.74} \cdot l_{u1}^{0.7} \cdot W_2^{1.7}}{\gamma}} = 2.492$$

West to East

$$l_{u2} := 26$$

$$h_{d2} := 1.5 \cdot \sqrt{\frac{p_g^{0.74} \cdot l_{u2}^{0.7} \cdot W_2^{1.7}}{\gamma}} = 2.492$$

$$W_1 := \frac{8}{3} \cdot h_{d1} \cdot \sqrt{S} = 11.508$$

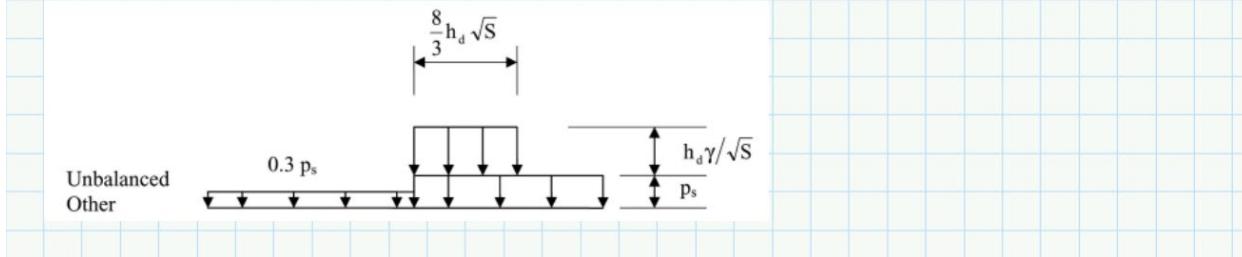

$$W_2 := \frac{8}{3} \cdot h_{d2} \cdot \sqrt{S} = 11.508$$

$$p_{d1} := \frac{h_{d1} \cdot \gamma}{\sqrt{S}} = 27.245$$

$$p_{d2} := \frac{h_{d2} \cdot \gamma}{\sqrt{S}} = 27.245$$

## Playground Feature Details

---

### Hank Drum (Tongue Drum)

**NMS-STD**

**Shipping Weight: 18 lbs**

**Shipping Dimensions: 16" L X 13" W X 13" H**

**Brand: Natural Playgrounds Company**

**Toxicity: Krylon Clear Coat**

**Age Appropriateness: all ages**

---

Children absolutely love these steel "Tongue Drums" (also called Hank Drums, Tank Drums, or Cylinder Drums). They produce resonant, bongy sounds that vibrate up and through a child's body.

The 12" round drum is 14" high and produces different tones from the 6 tongues cut into the top of the drum.

Each drum is uniquely finished with a deep green base with lighter overtones that give it depth, all of which are exterior colors chosen to blend in with natural settings. We then clear coat the surface for long-lasting exterior exposure and use.

Each drum is mounted on a threaded metal pipe so that it looks like a large bud on top of a stalk.

These drums are ready to play "out of the box."

Installation instructions included, but we also make these with wooden legs so they are self-supporting and can be taken and used inside, as well (see the other listing in the store).

A note about why drums are so very important on your playground:

Research indicates that drumming induces relaxation by enhancing theta-wave production and brain-wave synchronization.

Drumming produces pleasurable experiences, enhanced awareness of preconscious dynamics, release of emotional trauma, and reintegration of self.

Drumming alleviates self-centeredness, isolation, and alienation, creating a sense of connectedness with self and others.

Drumming provides a secular approach to accessing a higher power...

Hank Drums are to be played with hands, fingers, and other soft objects (in other words, not sticks, pebbles, stones, rocks, boards, heavy mallets). Otherwise, the clearcoat cover and underlying paint may chip, which will then cause the metal drum to rust! Also, heavy beating on the drum tongues with a fist or other large/heavy objects may cause the tongues to bend or break. Neither of these is covered by the warranty!

## Wind Chimes

**NMS-WC**

**Shipping Weight: 14 lbs**

**Shipping Dimensions: 24" L X 16" W X 4" H**

**Brand: Natural Playgrounds Company**

**Toxicity: child friendly wood preservative**

**Age Appropriateness: all ages**

---

Wind Chimes have their origins in Indian wind bells which were suspended on the corners of pagodas to scare away evil spirits.

Our chimes are long and made with 1-1/2" pipes, so the sound is unbelievable, full of long-lasting, multi-toned resonance that's just beautiful!

When played by the wind or children, a single chime produces a fundamental sound with a variety of additional overtones, so when our chimes start moving, many, many different tones and overtones are produced, making this instrument sound truly magical.

Depending on where they're hung, when they start ringing, Wind Chimes can indicate a change in wind direction or velocities, so children will always know when air is in motion. This, of course, can lead to imaginative stories about wind elves and fairies ringing the chimes, or to discussions about wind and why the air moves, or about clouds moving, birds in flight, kites flying, and so on.

These silver-colored Wind Chimes are a beautiful, outdoor musical instrument that can be hung anywhere. They can be played both by the wind and by children gently brushing the pipes.

Because each is hand made, and none is ever made exactly the same, placing several of these in different places on your Natural Playground will provide endless, beautiful entertainment for children and adults alike.

Made to hang from anything such as a tree branch or any other support off the ground, installation is very easy. Endlessly delightful!

## Pedestal Pipes

**NMS-PP**

**Shipping Weight: 37 lbs**

**Shipping Dimensions: 72"L X 10"W X 10"H**

**Brand: Natural Playgrounds Company**

**Toxicity: child friendly wood preservative**

**Age Appropriateness: all ages**

---

The "Pedestal Pipe" is a beautiful, outdoor musical instrument that has different melodious sounds depending on the size of each pipe.

We like to scatter several of them in wildflower meadows or in sound gardens.

Each set produces distinctly different sounds depending on the the length of the pipe and whatever the child uses to strike the pipe, so the sound is always changing, and always delightful!

Children love to explore the sounds, become intrigued with the tonal variations, and then search for a series of "notes" that play familiar songs.

Pedestal Pipes come with a single post that can be mounted at any height in any location.

If Pedestal Pipes are purchased for indoor use, the post is shortened and sturdy feet are included.

Comes with easy assembly and installation instructions and a mallet.

<embed height="10" width="100" src="/sounds/PedPipe.mp3" />

## Musical Fences

**NMS-MF4**

**Shipping Weight: 70 lbs**

**Shipping Dimensions: 49" L X 29" W X 6" H**

**Brand: Natural Playgrounds Company**

**Toxicity: child friendly wood preservative**

**Age Appropriateness: preschool**

---

This description is for our 4' Musical Fence which is designed for younger children (You'll find the same description under our 6' fence for older children).

Our unique Musical Fence is sized to fit within a Natural Playground setting as part of the music/sound garden. The fence frame is cedar, and it holds vertical, galvanized, metal tubes spaced closely together so that children walking or running along the fence while dragging their hand or a stick along the pipes make percussive musical sounds (like in the old days of running a stick along fence balusters).

But the neat thing, is that when kids swipe their hands across all the tubes, the tubes swing into each other, thus setting off a series of resounding, random notes that sound just like wind chimes (but with much deeper sounds). Further, a child can also strike the individual tubes with a stick or a stone to create individual notes!

This is sort of like a giant chime, but it's operated by kid and not the wind (well, unless it's a hurricane! :)

This wonderfully inventive, unique musical instrument teaches many lessons about rhythm, movement, and sound. The pipes are not "tuned" for a very simple reason: Children need to "find" sounds on the playground, just as they find and hear different sounds in nature. If they're given perfectly tuned pipes in consecutive order, then they will always think that musical sounds are always perfectly pitched and "come" that way.

Our pipes teach them about the randomness of sounds and notes, and that making traditional "music" is up to them.

In-ground installation instructions are included. Built/installed dimensions for the 4' Fence: L=48", W=12", H=43" without the roof.

Note: If you want the four foot Musical Fence for use inside (or even outside when you don't have the option of mounting it in the ground), just choose the "with feet" option from the pull down menu (see photo below). There is an extra charge for the feet.

<embed autostart="false" height="10" width="100" src="/sounds/WithBands.m4a" />

## Hollow Log

**FTTP-HL**

**Shipping Weight: 300 lbs**

**Shipping Dimensions: 36" L X 28" W X 28" H**

**Brand: Natural Playgrounds Company**

**Toxicity: non-toxic**

**Age Appropriateness: all ages**

---

There is nothing like a hollow log! It smells fabulous, looks phenomenal, it's fun to be inside it, and it is certainly a VERY natural play element.

Kids get to see wood grain and growth rings up close, see how branches connect to the tree trunk, and even see what a tree looks like on the inside!

Keep in mind, that just as each tree is different, each of the 3' long or 4' long hollow logs which have a ~23" diameter core (through which even fit adults can crawl) is different, because each one is uniquely-shaped on the outside -- which is why it's such a fabulous addition to your playground!!

The Hollow Log usually comes with bark on it, which looks very nice, but when the log dries and shrinks, it MAY start falling off. If you want us to peel and then treat the log on the outside, we offer that option.

Keep in mind that these heavy logs are usually round or close to it, so with some effort they could be rolled. If you perceive this to be an issue, we suggest ordering the stabilizers running the length of the log on 2 sides.

Maintenance: You may notice occasional mold growing on the surfaces of the log. This is completely normal. A mixture of 1 : 1 bleach and water applied with a stiff brush will wipe it away!

Lastly, these are heavy items, so we ship them by freight. If you don't have a loading dock, ask the shipper for a lift gate which will lower the pallet to the ground. If that's not possible, get lots of strong people to help unload. The bigger ones might weigh up to 500+ pounds.

But they are well worth the weight :))

A NOTE about sap:

All trees have sap. It's the liquid that circulates inside the tree to distribute water and nutrients. It's how they feed themselves. It's the "blood" of a tree.

We make our hollow logs from large pines that are being removed from construction sites, so you're going to see and maybe feel some sap/pitch.

We heat the sap with our commercial heat gun until it crystallizes. If you have issues, you can do the same, possibly using a

regular heat gun or a small propane torch.

To remove sap from hands? Try a hand sanitizer.

## Fort

### TDG-FORT

**Shipping Weight: lbs**

**Shipping Dimensions: "L X "W X "H**

**Brand: Natural Playgrounds Company**

**Toxicity:**

**Age Appropriateness:**

---

There is nothing more exciting to kids than a playground Fort, and ours is meant to be installed on flat ground or embedded into a hill (or mountain :)

This playground Fort is about 22" deep from the top of the posts and walls down to the ground, but it is very, very easy to make this Fort less deep! (see instructions).

Big kids can crawl out of it as is, but small kids can, too. However, if you want to help the smaller kids get out even more easily, follow the simple instructions to make the walls shorter, or to keep it challenging and add more learning/discovery opportunities, buy two or more of our stepping stumps, like 8", 10", and 12" high ones to make steps inside the fort (or do both!)

Once the Fort's in place, you can add a tall post with a flag on it to make the experience more imaginary.

Our octagonal Forts are either 8' or ~11' across measured from flat side to opposite flat side.

If embedded into the ground, this playground Fort is essentially in a hole, so it should probably be drained, but that's easy to do, especially if you're building a hill around it (again, see the instructions)!

## Sitting Stumps (set of 4)

**TSCLP-SS**

**Shipping Weight: 400 lbs**

**Shipping Dimensions: 48.00" L X 40.00" W X 22" H**

**Brand: Natural Playgrounds Company**

**Toxicity: child friendly wood preservative**

**Age Appropriateness: all ages**

---

The Sitting Stumps, cut from real logs as part of a forest management, thinning project in northern New England, are a fantastic way to bring pieces of one of nature's most beautiful creations onto the playground.

These can be placed 6' apart for a safe outdoor classroom, and arranged in front of a chalkboard and/or demonstration table (see elsewhere in the store).

The various-sized, easily manipulated sitting stumps can also be used for loose parts, stacking, imaginative play, and amphitheater seating.

Natural log Sitting Stumps will range from 10" (great for toddlers) to 15" high, unless otherwise specified, and are ~12" diameter. Come as a set of 4, but can be sold individually.

Because they are natural, Sitting Stumps will exhibit cracks or splits as they dry out over time, but this will only add to their beauty and teach children about natural processes. It will not reduce the structural integrity of the Sitting Stumps.

They'll last a long, long time (years and years!) without much sign of wear anyway; we want children to know what real wood smells like (and not smell some kind of oil or mineral smell that gives off a weird odor when the stumps are in the hot sun); and we want the children to see and observe the inevitable changes that will occur over a long period of time!

Because bark clings to the trunk differently depending on the seasons throughout the year, sometime being loose, and sometime being tight, we have never been able to guarantee that any of our tree products will come with bark. Unfortunately, sometimes it looks great leaving our shop, but when it gets to the customer, some of the bark has fallen off, which then doesn't look great, then some people complain....

So you do have the option of having us peel off all the bark, and then treating the Sitting Stumps with child-friendly preservative for a long lasting product.

Four 12"+/- D x 12-15"+/- H natural sitting stumps

NOTE: if you need longer stumps for use as vertical retainers in a sand play area, or on a hill, let us know. We can cut them to any length.

## **Picnic Table (child)**

**NF-PT**

**Shipping Weight: 28 lbs**

**Shipping Dimensions: 36" L X 21" W X 10" H**

**Brand: Natural Playgrounds Company**

**Toxicity: child friendly wood preservative**

**Age Appropriateness: preschool**

---

Full-sized picnic tables can be obtrusive on playgrounds and are not comfortable for children, so these mini picnic tables are a perfect height and are definitely a must have for any natural playground/outdoor learning environment.

We can make them any size (just ask!), but the one shown here is for children from 3-6 years old, and seats 4-6 comfortably.

The splinter-free, weather-resistant Cedar, Mini Picnic Table comes as a kit, and is sanded smooth with rounded corners and edges for safety. The tables have a perfect kid-sized 22"x 36" top, with a table height of 20", and a seat height of 12".

Cedar will weather and age naturally, but will be best if treated with a kid-friendly treatment (see our child-friendly preservative under Maintenance in the store). Please specify if you want the table treated, and we will be happy to apply a non-toxic preservative that, for the most part, maintains the natural color and texture of the table.

Light weight! Very portable!...yet very durable.

## Weather Station

**SSC-weather**

**Shipping Weight: 100 lbs**

**Shipping Dimensions: 72" L X 30" W X 10" H**

**Brand: Natural Playgrounds Company**

**Toxicity: child friendly wood preservative**

**Age Appropriateness: all ages**

---

Our fabulous, easy-to-read Weather Station has 5 very good sensors that collect data related to the weather and environment.

What better way to get the children involved in the environment around them? If they see the numbers and measurements, and you teach them how to take notes about what's happening hour-to-hour, or day-to-day, they will begin to understand the relationships between the varying measurements!

Once they understand that, they'll be able to make their own weather forecasts!

How cool is that??!!

### Types of Sensors

The following measurement devices are included with the Natural Playgrounds Weather Station:

Thermometer, that measures air temperature in degrees, with an Hygrometer that measures the amount of moisture in the air.

Barometer - Measures the weight of the air above you. It changes with the temperature. However, barometers are designed to work at 3000 foot elevations or less. If you're in a higher elevation, we will adjust the instrument to work at your elevation, but you have to let us know!!!

Anemometer - Measures how fast the wind is blowing, or wind speed. This is a very accurate instrument, not a cheesy play toy :)

Weather Vane indicator - Shows which direction the wind is blowing (also Wind Vane). This red vane is also the wind collector which takes the pressure of the wind into the big red tube and directs it through the white tube into the indicator.

Rain Gauge - Measures the amount of rain that falls to the ground.

The instruments are made for outdoor use. We recommend mounting the post high enough off the ground that kids can see BUT CAN'T REACH the instruments. These are delicate instruments and are not able to withstand abuse (or, obviously, vandalism), so please advise your teachers and set some strict guidelines for how kids interact with and respect the Weather

Station.

Easy installation instructions included!

## Magnifying Station

### SSC Magnifying

**Shipping Weight: 30 lbs**

**Shipping Dimensions: 72" L X 15" W X 8" H**

**Brand: Natural Playgrounds Company**

**Toxicity: child friendly wood preservative**

**Age Appropriateness: all ages**

---

This brand new, science learning element is designed to help children understand and better connect with nature.

The indestructible magnifying glass gives kids 5x magnification. That means that whatever they hold about 8" under the glass will be enlarged 5 times its size!! so they see everything in great detail!

They'll be able to see the small veins in a leaf, the hairs on spiders' legs, cobweb strands, particles of sand that'll look like small pebbles, the cells in their own skin, essentially everything with a fresh eye.

The reason we designed a cantilever arm is so kids can put big things under it. Compare this fabulous feature to other magnifiers, all of which offer a very limited viewing area that children can't even get their hands under!

Don't delay! Get this inexpensive, fabulous science tool immediately, and watch your children be amazed as they run all over the playground finding different things to investigate.

You might need more than one :))

The Magnifying Station can be installed into the ground, or if you want, you can purchase just the glass mounted in the arm so you can use it inside or outside whenever the occasion warrants. Both options include the slipover lens cover.

The instrument is made for outdoor use.

Easy installation instructions included!

NOTE: As with any type of magnifying lens (binocular, reading glasses, old bottle bottom, raindrop, etc), this magnifying glass has a focal length (this one is 7-7/8") which concentrates light at that point.

Light is made up of photons, or tiny particles of energy, so if the sun's light is concentrated on a small area, it can get get very hot!

We all tried this when we were kids! I remember having this real cheap magnifying glass, and it was great fun concentrating the sun's energy on one point to see what would happen. It felt like a prick on my skin, or you could burn a hole through a leaf, or ... :)

It's also possible that as the Earth turns, and the sun's position changes, vegetation under the magnifying station may suffer

from too much intense heat, which is another reason to always use the slipover cover which blocks the sun entirely.

## Log Benches

**NF-LB**

**Shipping Weight: 250 lbs**

**Shipping Dimensions: 48.00" L X 14" W X 14" H**

**Brand: Natural Playgrounds**

**Toxicity: child friendly wood preservative**

**Age Appropriateness: all ages**

---

Children want places to sit and look at a bug, to lean against, to talk with friends, or to just watch what's going on in the playground.

Teachers also love comfortable places to sit and watch what's going on, or to sit with their "buddies," or to console a child.

Log Benches made from real, whole logs, are particularly attractive features as they blend in with the natural theme yet are practical and low cost.

The very beautiful-looking, 48" long Milled Log Benches are milled top and bottom so they rest flat on the ground and there is a flat top for sitting. They are then sanded and treated with child-friendly preservative that should be reapplied 2-3 times/year (you can use a garden sprayer). They are typically about 15" high.

For the whole log benches, bark will likely still be on the log, so children can see and study bark up close, try to identify the type of tree, and play with its texture. The bench also gives off the wonderful, natural smell of wood, and as it ages, the bark will slough off and expose the smooth surface of the tree wood beneath.

Logs used in the benches are treated when they leave our shop, and should be treated with a good child-friendly preservative 2-3 times/year to keep them from drying out. Logs are typically about 8" diameter, 48" long, and when mounted on the bases, are 10-16" tall (depending on requested height). Bench for toddlers is 10" height. Ages 2+ would be 14-16" height.

Whole Log Bench comes as a three-piece kit. No installation is required; sit on it as soon as you get it!

Two, separate Whole Log Benches are shown in the photo. The price is for a single Log Bench.

These Whole Log Benches may be fixed to the ground, so order accordingly.

During the season when the bark is "tight," we will probably make the decision to keep it on. However, should it arrive on your premises without bark, it's because it was cut during the "loose bark" season, and therefore subject to shipping damage.

For those of you who want a long-lasting, glossy, clear marine finish, we offer that option for any bench that is debarked, so if you want this, you also have to order the debarking.

## Chin Up Bars

**SP-ACUPB**

**Shipping Weight: 125 lbs**

**Shipping Dimensions: 48"L X 10"W X 10"H**

**Brand: Natural Playgrounds**

**Toxicity: child friendly wood preservative**

**Age Appropriateness: all ages**

---

One of the greatest upper body challenges, the Chin-Up/Pull-Up Bars are a must-have on any playground, fitness course, or challenge course.

We have found that children as young as toddlers love to hang from bars, so this infinitely versatile play element can be made for any age group, up to and including adults. Also, because the bars can be mounted side by side, and at different heights, they can be used for hanging, pull-ups, chin-ups, push-ups, and simple gymnastic exercises.

By the way, pull ups is undoubtedly the most universal exercise used by climbers who lock their elbows at 90° and 135° for extended periods of time. This exercise is also called "Frenchy."

The Chin Up Bar comes in 3 different versions. The Adjustable is just that. It will easily adjust for any age, from young children to adults. Just lift it up, and reset it in any of the slots.

The Double consists of 3 posts in a line, and the Triple consists of 4 posts making a straight line or an L (your choice).

If you're looking for a similar item, we suggest you look at our Horizontal Ladders.

Comes with complete installation instructions.

For schools and public playgrounds, a fall zone would be required.

Costs estimated based on quote provided by Kompan, Crouch Recreation, and The Henley Group (12/11/2025).

## Workout Equipment Details

### Multi Net

FSW207

Post are made of Ø101.6 x 2mm, pre-galvanized carbon steel and powder coated, a great protection to all conditions.

The connectors are made of die-cast aluminium, specially alloyed for the outdoor environments and heavy usage. The screws attaching the connectors are stainless steel and protected by zinc washers.

The ropes are made of UV-stabilised PES with inner steel cable reinforcement. The rope is induction treated in order to create a strong connection between steel and rope which leads to good wear resistance.

Item no. FSW20700-0000

## Pull Up Station

FSW208

Post are made of Ø101.6 x 2mm, pre-galvanized carbon steel and powder coated, a great protection to all conditions.

The connectors are made of die-cast aluminium, specially alloyed for the outdoor environments and heavy usage. The screws attaching the connectors are stainless steel and protected by zinc washers.

All bars intended for pull ups are made of solid, Ø32mm x 138 m, hot dip galvanised, S235JR steel bars. This diameter gives the right grip for everyone.

Item no. FSW20802-0901

### Installation Information

|                          |   |
|--------------------------|---|
| Max. fall height         | 133 cm  |
| Safety surfacing area    | 15.6 m <sup>2</sup>   |
| Total installation time  | 2.9 hours   |
| Excavation volume        | 0.53 m <sup>3</sup>   |
| Concrete volume          | 0.30 m <sup>3</sup>   |
| Footing depth (standard) | 90 cm   |
| Shipment weight          | 106 kg  |
| Anchoring options        | In-ground <input checked="" type="checkbox"/> Surface <input checked="" type="checkbox"/> |

### Warranty Information

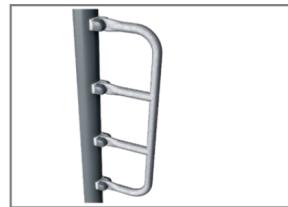

|                          |          |

| Hot dip galvanised steel | Lifetime |
| Post                     | 10 years |
| Connectors               | 10 years |
| Spare parts guaranteed   | 10 years |

All KOMPAN fitness products are compliant with the ASTM F3101 & EN16630 Outdoor Fitness Standards. Load tests are performed as a static test by adding dynamic factors as well as safety factors to the specified load of 78kg per user. A product intended for 1 user is loaded with 420kg.

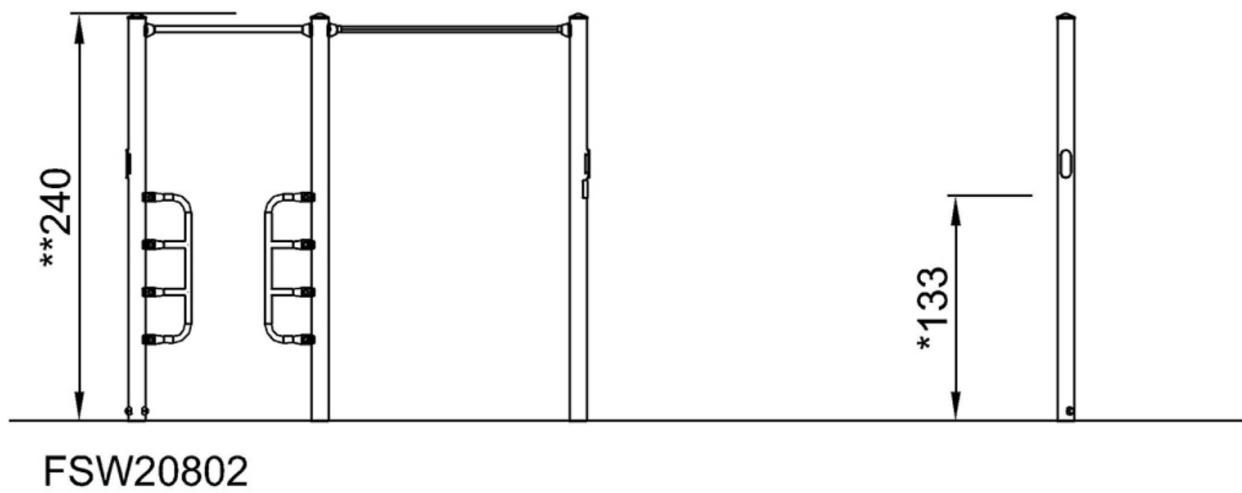

The information sign is made of a PA6 (Polyamide) and shows the most relevant exercise and a QR code. When scanned the QR code will link to an animated illustration of the exercise and offers the possibility of downloading the KOMPAN sport & fitness App, which will provide a large amount of exercises and workouts.

The handles offer 4 different heights to place the hands or feet

## Agora Steel Bench with Backrest

PAR4054

The steel surfaces are hot dip galvanized inside and outside with lead free zinc. The galvanization has excellent corrosion resistance in outdoor environments and require low maintenance. Painted steel parts are hot dip galvanized before powder coating.

Powder coated top finish on top of galvanisation is processed in two steps: Light grinding and clean sweeping, powder coating - thickness 70-120 µm.

The Agora full steel assortment is available as standard in 9 different colors to match the selected color scheme on the play, sport or fitness site.

Item no. PAR4054-0609

### Installation Information

|                          |   |
|--------------------------|---|
| Total installation time  | 1.5 hours   |
| Excavation volume        | 0.19 m <sup>3</sup>   |
| Concrete volume          | 0.13 m <sup>3</sup>   |
| Footing depth (standard) | 60 cm   |
| Shipment weight          | 73 kg   |
| Anchoring options        | Surface <input checked="" type="checkbox"/> In-ground <input checked="" type="checkbox"/> |

### Warranty Information

|----------------------------|----------|
| Hot dip galvanised steel   | Lifetime |
| Painted toplayer           | 10 years |
| Stainless steel components | Lifetime |
| Spare parts guaranteed     | 10 years |

KOMPAN outdoor furniture is available for surface and in-ground installation. Surface installation by anchoring to base layer or in-ground installation as either direct in ground or additional hot dip galvanized steel brackets.

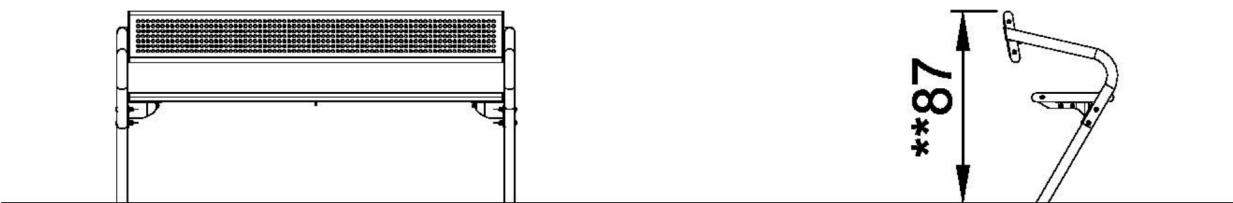

The benches and tables can be combined in multiple settings by choosing individual products or assembled into larger solutions. See catalogue pages for more inspiration.

The hardware is made of stainless steel or galvanised steel to ensure durable connections with a high corrosion resistance.

## Combi 3

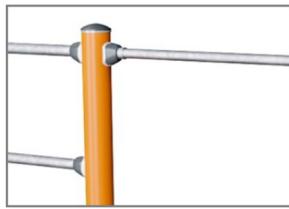

FPW103

Post are made of Ø101.6 x 2mm, pre-galvanized carbon steel and powder coated, a great protection to all conditions.

The connectors are made of die-cast aluminium, specially alloyed for the outdoor environments and heavy usage. The screws attaching the connectors are stainless steel and protected by zinc washers.

All bars intended for pull ups are made of solid, Ø32mm x 138 m, hot dip galvanised, S235JR steel bars. This diameter gives the right grip for everyone.

The push up bars features three 38 x 2mm push up bars at three heights of respectively 38cm, 58cm and 99cm.

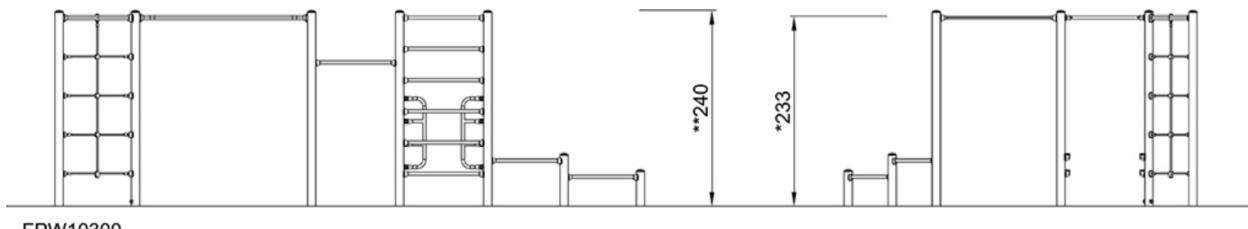

Corcord 16mm ropes of UV-stabilized PES rope strands with inner steel cable reinforcement. The polyester yarn is made from +95% post-consumer materials and is inductively melted onto each strand. The ropes are highly wear-and vandalism-resistant and can be replaced at site if needed.

## Appendix L-Parking Lots

**Table 8C-1.01:** Parking Ratios

| Land Use                                  | Spaces per Unit   |
|---|---|
| <i>Residential and Lodging</i>            |   |
| Single and two family dwellings           | 2.0 / unit (tandem parking allowed)   |
| Row dwellings                             | 2.0 / unit + 1 visitor space per 4 units  |
| Multiple family (apartment and condo)     | 1 to 2 bedroom units: 2.0 spaces / unit<br>3+ bedroom units: 2.5 spaces per unit<br>plus 3.0 / 1,000 sf of GFA for lease management |
| Mobile home park                          | 2.0 / unit (tandem parking allowed)<br>plus 1 visitor space per 10 units<br>plus 3.0 / 1,000 sf of GFA for lease management         |
| Housing for seniors                       | 1.0 / unit<br>plus 10 / 1,000 sf of GFA for multipurpose buildings  |
| Hotel/motel                               | 1.25 / room + 10 / 1,000 sf of GFA of lounge or restaurant + 20 / 1,000 sf of GFA of conference or banquet facilities               |
| <i>Retail Sales and Services</i>          |   |
| General and convenience retail            | 2.75 / 1,000 sf of GFA  |
| Grocery stores                            | 6.75 / 1,000 sf of GFA  |
| Heavy/hard goods                          | 2.5 / 1,000 sf of GFA, including outdoor sales area   |
| Discount superstores                      | 5.5 / 1,000 sf of GFA, including outdoor sales area   |
| Specialty superstores                     | 4.5 / 1,000 sf of GFA, including outdoor sales area   |
| Shopping center                           | Special parking study required  |
| <i>Food and Beverage Services</i>         |   |
| Restaurant, sit down                      | 10 / 1,000 sf of GFA  |
| Restaurant, fast food                     | 1.5 / 1,000 sf of GFA   |
| Restaurant, take out only                 | 2 / 1,000 sf of GFA   |
| Bar/nightclub                             | 10 / 1,000 sf of GFA  |
| <i>Office and Business Services</i>       |   |
| < 25,000 sf of GFA                        | 3.8 / 1,000 sf of GFA   |
| 25,000 to 100,000 sf of GFA               | Scale between 3.8 and 3.4 / 1,000 sf of GFA   |
| 100,000 sf of GFA                         | 3.4 / 1,000 sf of GFA   |
| Consumer services                         | 4.6 / 1,000 sf of GFA   |
| Data processing and telemarketing         | 6.0 / 1,000 sf of GFA   |
| Medical office (not part of hospital)     | 4.5 / 1,000 sf of GFA   |
| <i>Industrial, Storage, and Wholesale</i> |   |
| Manufacturing or industrial               | 1.85 / 1,000 sf of GFA, plus parking for office, sales, or similar use where those uses exceed 10% of sf of GFA                     |
| Storage or wholesale                      | 0.67 / 1,000 sf of GFA  |
| Mini-warehouse                            | 1.75 / 1,000  |
| <i>Educational or Institutional Uses</i>  |   |
| Elementary or middle schools              | 1.0 / employee + 10 spaces for visitors   |
| High school                               | 1.0 / employee + 0.3 / student  |
| Church or theatre                         | 0.4 / seat  |

GFA: Gross Floor Area means the area in square feet within the exterior walls of a building, exclusive of any area used for off-street parking, courtyards, or mechanical equipment.
